We saw, in six days' travelling, the several *seasons* of the year in their beauty. *Addison.*

We distinguish the season by prefixing its appropriate name, as the spring-season, summer-season, &c. In *astron.*, the seasons are considered as beginning respectively when the sun enters the signs Aries, Cancer, Capricorn, and Libra. Hence the spring season commences about the 21st of March; summer about the 22d of June; autumn about the 23d of September; and winter about the 23d of December. The change of seasons may be divided into those which always recur every year in regular order, and those which are different in different years. The regular changes are explained by the sun's (or earth's) motion; and the irregular depend upon atmospheric and other circumstances, and belong to the science of meteorology.—*To be in season*, to be in good time, or sufficiently early for the purpose.—*To be out of season*, to be too late, beyond the proper time, or beyond the usual or appointed time.—From the sense of convenience, is derived the following: 5. That which matures or prepares for the taste; that which gives a relish.

You lack the *season* of all nature, sleep. *Shak.*

But in this sense, we now use *seasoning*.

SECEDER. *n.* One who secedes. In *Scotland*, the *seceders* are a numerous body of presbyterians who seceded from the communion of the established church, in the year 1733, on account of the toleration of certain alleged errors, the evils of patronage, and general laxity in discipline. The seceders or Associate Synod, as they called themselves, remained a united body till 1747, when they split into two on a quarrel about a clause in the oath required to be taken by the burgesses or freemen of some of the Scottish burghs, declaratory of their profession and hearty allowance of the "true religion at present professed within the realm, and authorized by the laws thereof;" the larger division, who held that the oath might be conscientiously taken by seceders, calling themselves burghers, and their opponents taking the name of antiburghers. But in 1820, the burghers and antiburghers coalesced again into the United Associate Synod. A portion of the body of seceders, who adhered to the principle of an established church, separated in 1806, calling themselves the original seceders. They now form the Synod of United Original Seceders. In May, 1847, the body of dissenters forming the Relief Synod, and comprehending eleven pres-

byteries, united with the Associate Synod, and formed one body, named the United Presbyterian Church.

SECRE'TION, *n.* The act of secerning; the act or process by which substances are separated from the blood, differing from the blood itself, or from any of its constituents, as bile, saliva, mucus, urine, &c. This was considered by the older physiologists as merely a separation from the blood of certain substances previously contained in it, the literal meaning of *secretion*; but this opinion is now generally exploded. The organs of secretion are of very various form and structure, but the most general are those called *glands.* The animal secretions are arranged by Bostock under the heads aqueous, albuminous, mucous, gelatinous, fibrinous, oleaginous, resinous and saline. Magendie arranges them into three sorts, 1. *Exhalations*, which are either external, as those from the skin and mucous membranes; and internal; as those from the surfaces of the closed cavities of the body, and the lungs.—2. *Follicular secretions*, which are divided into mucous and cutaneous; and 3. *Glandular secretions*, such as milk, bile, urine, saliva, tears, &c. Every organ and part of the body secretes for itself the nutriment which it requires.—2. The matter secreted, as mucus, perspirable matter, &c.—3. The process by which substances are separated from the sap of vegetables, also the matter secreted. The descending sap of plants is not merely subservient to nutrition, but furnishes various matters which are secreted or separated from its mass, and afterwards elaborated by particular organs. These secretions are exceedingly numerous, and constitute the great bulk of the solid parts of plants. They have been divided into, 1. *General or Nutritious secretions*, the component parts of which are gum, sugar, starch, lignine, albumen, and gluten; and 2. *Special or local secretions*, which may be arranged under the heads of acids, alkalies, neuter principles, resinous principles, colouring matters, milks, oils, resins, &c.

Among the Jews, the principal *sects* were the Pharisees, Sadducees, and Essenes. In Greece were the Cynic *sect,* founded by Antisthenes; and the Academic *sect,* by Plato. In laws, a *section* is sometimes called a paragraph or article.—4. When a plane is cut by a plane, the section is a straight line, called the *common* section of the two planes. 2. A mathematical instrument so marked with lines of sines, tangents, secants, chords, &c., as to fit all radii and scales, and useful in making diagrams, laying down plans, &c. Its principal advantage consists in the facility with which it gives a graphical determination of proportional quantities. It becomes incorrect, comparatively, when the opening is great, or the result greater than the data. The sector is founded on the fourth proposition of the sixth book of Euclid, where it is proved that equiangular triangles have their homologous sides proportional. It consists of two rulers, (generally of brass or ivory), representing the radii of a circular arc, and moveable round a joint, the middle of which forms the centre of the circle. From this centre, there are drawn on the faces of the rulers various scales, the choice of which, and the order of their arrangement, may be determined by a consideration of the uses for which the instrument is intended.—3. In *astr.*, an instrument constructed for the purpose of determining with great accuracy the zenith distances of stars, passing within a few degrees of the zenith, where the effect of refraction is small. *See* ZENITH.—*Dip sector,* an instrument used for measuring the dip of the horizon.

SEDI''TION, *n.* [Fr. from L. *seditio*; L. *sed-eo*; from *se*, a part, and *eo*, to go. The inseparable preposition *se* becomes *sed* before a vowel, in the same manner as *re* is changed into *red* before a vowel. *Sed-eo* must not be confounded with *sedeo*, to sit, the latter being derived from Gr. ἕζομαι, to sit. *Sedition*, then, may signify, literally, a separation, or departure from union or peace, from submission, or from obedience; hence, discord, dissension, insurrection amongst citizens.] A factious commotion of the people, or a tumultuous assembly of men rising in opposition to law, and in contravention of the public peace; Ezra iv.; Luke xxiii.; Acts xxiv.—2. In *law*, a general word, comprising, in common language, offences against the state which do not amount to high treason, but which tend to bring about or encourage the greater offence; such as the writing, publishing, or uttering of any words, tending to excite subjects to insurrection, though not urging them on to open rebellion, or total subversion of the government. The term *sedition*, however, is very difficult to define, and its meaning varies according to the state of political feeling at any given time. The act 36 Geo. III., provided against all seditious practices and attempts tending to high treason, and by the act 11 Victoria, the main provisions of the former were extended to Ireland, along with new enactments, which were made applicable to all parts of the United Kingdom. According to this latter act, now in force, any person or persons who shall, within the realm or without, compass, imagine, invent, devise, or intend to deprive or depose the Queen, her heirs and successors, from the style, honour, or royal name of the Imperial crown of this realm, or of any other of her Majesty's dominions and countries, or to levy war against her Majesty, her heirs and successors, within any part of the United Kingdom, in order by force or constraint to compel her or them to change her or their measures or counsels, or in order to put any force or constraint upon, or to intimidate or overawe both houses, or either house of parliament, or to move or stir any foreigner or stranger with force to invade the United Kingdom, or any other her Majesty's dominions, and such compassings, imaginations, inventions, devices, or intentions, or any of them, shall express, utter, or declare, by publishing any printing or writing, or by open and advised speaking, or by any overt act or deed, shall be deemed guilty of felony, and on being convicted, shall be liable, at the discretion of the court, to be transported beyond the seas for life, or for any term not less than seven years. Indictments for felony under this act are to be held valid, though the facts may amount to treason. In Scotland, the laws against sedition are more stringent than in England, being founded on old statutes against *leasing-making*, an offence still more difficult to define than sedition, though partaking generally of the same nature. Felonies under the present act in Scotland are not bailable, unless with consent of the public prosecutor, and the trial is to take place as prescribed by the act 1701.

In G. *gesuch* is a *suit*, a seeking, demand, petition; and *versuchen* is to try, Eng. *essay*. SEED, *n.* [Sax. *sæd;* G. *saat;* from the verb *sow.* Qu. W. *hâd*, Arm. *had.*] 1. The substance, animal or vegetable, which nature prepares for the reproduction and conservation of the species. In plants the seed is the impregnated and matured ovule, which may be defined a body within the pericarp, and containing an organized embryo, which on being placed in favourable circumstances is developed, and converted into an individual similar to that from which it derived its origin. The reproductive organs of flowerless plants, such as sea-weeds and mushrooms, differ in structure, and in their mode of germination, and are not considered as true seeds, but are named *sporules*. The seed is attached to the placenta by a small pedicel or *umbilical cord*, also named *podosperm*. In some plants this pedicel is usually expanded, and rising round the seed, forms a partial covering to it, named the *arillus;* as in the nutmeg, in which it constitutes the part called *mace*. The point of attachment of the cord or podosperm is named the *hilum*. The seed is composed of an external skin, the *testa* or *perisperm*, and a *kernel* or *nucleus*. In some cases, the seeds constitute the fruit or valuable part of plants, as in the case of wheat and other esculent grain; sometimes the seeds are inclosed in the fruit, as in apples and melons. When applied to animal matter, it has no plural.—2. That from which any thing springs; first principle; original; as, the *seeds* of virtue or vice.—3. Principle of production.

SEE'ING, *ppr.* [from *see.*] Perceiving by the eye; knowing; understanding; observing; beholding.

Note.—This participle, improperly classed by grammarians among conjunctions, appears to be used indefinitely, or without direct reference to a person or persons. "Wherefore come ye to me, *seeing* ye hate me?" Gen. xxvi. That is, since, or the fact being that or thus; because that. In this form of phraseology, *that* is understood or implied after *seeing*; why come ye to me, *seeing that*, ye hate me? The resolution of the phrase or sentence is, ye hate me; that fact being seen or known by you, why come ye to me? or, why come ye to me, ye seeing [knowing] that fact which follows, viz., ye hate me. In this case, *seeing* retains its participial character, although its relation to the pronoun is somewhat obscured. Originally, *seeing*, in this use, had direct relation to the speaker or to some other person. "Now I know that thou fearest God, *seeing* thou hast not withheld thy son;" Gen. xxii. Here *seeing* refers to *I*, or according to the language of syntax, agrees or accords with *I*. I know thou fearest God, for I *see* thou hast not withheld thine only son; I know thou fearest God by *seeing*, in consequence of *seeing* this fact, thou hast not withheld thine only son. But the use of *seeing* is extended to cases in which it can not be referred to a specific person or persons, in which cases it expresses the notoriety or admission of a fact in general, and is left, like the French *on*, in the phrases *on dit*, *on voit*, without application to any particular person.

SEE'ING, *n.* Sight; vision.

SEEK, *v. t. pret.* and *pp. sought*, pronounced *sawt*. [Sax. *secan*, *sæcan*, to seek, to come to; *asecan*, to require; *gesecan*, to seek, to come to; *forsacan*, *forsæcan*, to forsake; G. *suchen*, to seek; *absuchen*, to pick off; *besuchen*, to visit, to see; *gesuch*, suit, petition; *gesuche*, a continued seeking; *versuchen*, to try, prove, *essay*, strive; *versuch*, trial, *essay*; D. *zoeken*, to seek, to look for, to try or endeavour; *bezoeken*, to visit, to try; *gezoek*, a seeking; *opzoeken*, to seek; *verzoeken*, to request, desire, invite, try, tempt, to visit; Dan. *söger*, to seek, to endeavour; *besöger*, to visit; *forsöger*, to try, to *essay*, to experiment, to tempt; *opsöger*, to seek or search after; Sw. *söka*, to seek, to sue, to court; *söka en lagligen*, to sue one at law; *besöka*, to visit; *forsöka*, to try, to essay, to tempt. These words all accord with L. *sequor*, Ir. *seichim*, to follow; for to *seek* is to go after, and the primary sense is to advance, to press, to drive forward, as in the L. *peto*. *See* ESSAY, from the same root, through the Italian and French. Now in Sax. *forsacan*, *forsæcan*, is to *forsake*; *sacan* is to strive, contend, whence English *sake*, and *sæcan*, *secan*, is to seek. But in Swedish, *försaka*, to forsake, to renounce, is from *sak*, thing, cause, suit, Sax. *saca*, English *sake*; in Danish, *forsager*, to renounce, is from *siger*, to say; *sag*, a thing, cause, matter, suit; *sagd*, a saying; G. *versagen*, to deny, to renounce, from *sagen*, to *say*, to tell; D. *verzaaken*, to deny, to *forsake*, to revoke, from *saak*, thing, cause, and *zeggen* is to say or tell, which is the Sax. *secgan*, to say. These close affinities prove that *seek*, *essay*, *say*, and L. *sequor*, are all from one radix, coinciding with Ch. עסק, *asak*, to seek, to strive. The English verb *see* seems to be from the same root.] 1. To go in search or quest of; to look for; to search for by going from place to place.

> The man asked him, saying, What *seekest* thou? And he said, I *seek* my brethren; Gen. xxxvii.

>
> He found no place for repentance, though he *sought* it carefully with tears; Heb. xii.
>
> Others tempting him, *sought* of him a sign; Luke xi.

3. *Seek* is followed sometimes by *out* or *after*. To *seek out*, properly implies to look for a specific thing among a number. But in general, the use of *out* and *after* with *seek*, is unnecessary and inelegant.—*To seek God, his name*, or *his face*, in Scripture, to ask for his favour, direction and assistance; Ps. lxiii.; lxxxiii.—*God seeks men*, when he fixes his love on them, and by his word and Spirit, and the righteousness of Christ, reclaims and recovers them from their miserable condition as sinners; Ezek. xxxiv; Ps. cxix; Luke xv.—*To seek after the life*, or *soul*, to attempt by arts or machinations; or to attempt to destroy or ruin; Ps. xxxv.—*To seek peace*, or *judgment*, to endeavour to promote it; or to practise it; Ps. xxxiv; Is. i.—*To seek an altar, temple*, or habitation, to frequent it; to resort to it often; 2 Chron. i; Amos v.—*To seek out God's works*, to endeavour to understand them, Ps. cxi.

SEEM, *v. i.* [G. *ziemen*, to become, to be fit or suitable; *geziemen*, to become, to *beseem*, to be meet, decent, *seemly*. In D. *zweemen* is to be like, to resemble, and *taamen* is to fit or suit, to become. In Dan. *söm* is a *seam*, and *sömmer*, signifies to hem, and also to become, to *beseem*, to be suitable, decent, or *seemly*. This is certainly the G. *ziemen*; hence we see that *seam* and *seem* are radically the same word: It. *sembrare*, to seem; *sembiante*, like, similar, resembling; *rassembrare*, to resemble; Sp. *semejar*, to be like; Fr. *sembler*, to seem, to appear. These words seem to be of one family, having for their radical sense, to extend to, to meet, to unite, to come together, or to press together. If so, the Dutch *taamen* leads us to the oriental roots, Heb. Ch. and Syr. דמה, *damah*, to be like; Eth. *adam*, to please, to suit; Ar. *adamâ*, to add, to unite, to agree, to suit, to conciliate, to confirm concord. These verbs are radically one, and in these we find the primary sense of *Adam*; likeness, or form.] 1. To appear; to make or have a show or semblance.

SELENIT'ICAL, }

SELE'NIUM, *n.* [supra.] An elementary acidifying and basifying substance, extracted from the pyrite of Fahlun in Sweden, and discovered in 1818 by Berzelius. In its general chemical habitudes it bears a resemblance to sulphur. It generally occurs in very small quantity in some of the varieties of iron pyrites. According to Dr. Prout, selenium constitutes the connecting link between sulphur and the metals. When precipitated, it appears as a red powder, which, when heated, melts, and on cooling, forms a brittle mass nearly black, but transmitting red light in their plates. When heated in the air it takes fire, burns with a blue flame, and produces a gaseous compound, oxide of selenium, which has a most penetrating and characteristic odour of putrid horse-radish.

SELENIURET, } *n.* A substance formed by the combination of sulphur, phosphorus, the earths, or the metals with selenium.
SELENURET, }

SELENIURETTED HYDROGEN, *n.* A gaseous compound of hydrogen and selenium, obtained by the action of acids on metallic seleniurets. It has a smell resembling that of sulphuretted hydrogen, and when respired, is even more poisonous than that gas. Seleniuretted hydrogen is absorbed by water, and precipitates most metallic solutions, yielding seleniurets, corresponding to the respective oxides.

SELENOGRAPH'ICAL, }

SELENOG'RAPHY, *n.* [Gr. σεληνη, the moon, and γραφω, to describe.] A description of the moon and its phenomena; a branch of cosmography.

SELF, *a.* or *pron. plur. Selves*; used chiefly in composition. [Sax. *self*, *sylf*; Dan. *selv*; G. *selbst*. The primary sense of this word is probably to set or unite, or to separate from others. *See* SELVEDGE.] 1. In old authors, this word sometimes signifies particular, very, or same. "*And on tham sylfan geare*;" in that same year, that very year; *Sax. Chron.* A.D. 1052, 1061.

Shoot another arrow that *self* way *Shak.*

On these *self* hills. *Ralegh.*

At that *self* moment enters Palamon *Dryden.*

In this sense, *self* is an adjective, and is now obsolete, except when followed by *same*; as, on the *self-same* day; the *self-same* hour; the *self-same* thing; which is tautology; Matth. viii.—2. In present usage, *self* is united to certain personal pronouns and pronominal adjectives, to express emphasis or distinction; also when the pronoun is used reciprocally. Thus for emphasis, I *myself* will write; I will examine for *myself*. Thou *thyself* shalt go; thou shalt see for *thyself*. You *yourself* shall write; you shall see for *yourself*. He *himself* shall write; he shall examine for *himself*. She *herself* shall write; she shall examine for *herself*. The child itself shall be carried; it shall be present *itself*. Reciprocally, I abhor *myself*; thou enrichest *thyself*; he loves *himself*; she admires *herself*; it pleases *itself*; we value *ourselves*; ye hurry *yourselves*; they see *themselves*. I did not hurt him, he hurt *himself*; he did not hurt me, I hurt *myself*. Except when added to pronouns used reciprocally, *self* serves to give emphasis to the pronoun, or to render the distinction expressed by it more emphatical. "*I myself* will decide," not only expresses my determination to decide, but the determination that no other shall decide. *Himself*, *herself*, *themselves*, are used in the nominative case, as well as in the objective.

Jesus *himself* baptized not, but his disciples; John iv.: *See* Matth. xxii. 4.

3. *Self* is sometimes used as a noun, noting the individual subject to his own contemplation or action, or noting identity of person. Consciousness makes every one to be what he calls *self*.

4. It also signifies personal interest, or love of private interest; selfishness.

The sense of *sell,* as we now understand the word, is wholly derivative; as we see by the Saxon phrases, *syllan to agenne,* to give for one's own; *syllan to gyfe,* to bestow for a gift, to bestow or confer gratis.] 1. To transfer property or the exclusive right of possession to another for an equivalent in money. It is correlative to *buy,* as one party *buys* what the other *sells.* It is distinguished from *exchange* or *barter,* in which one commodity is given for another; whereas in *selling* the consideration is money, or its representative in current notes. To this distinction there may be exceptions. "Esau *sold* his birthright to Jacob for a mess of pottage." But this is unusual. SENSA'TION, *n.* [Fr.; It. *sensazione*; Sp. *sensacion*; from L. *sensus*, *sentio*, to perceive. *See* SENSE.] The perception of external objects by means of the senses, or the effect produced on the sensorium by something acting on the bodily organs. When an impression made on the extremity of a nerve is communicated to the sensorium so as to excite the consciousness of the mind, it is called a *sensation*. When the impression is produced by the action of a foreign body on an external part, it is called an *external sensation*; when it proceeds from some change taking place within the living system, and arising from its own actions, it is termed an internal sensation; thus the impression communicated to the mind by the effect of light on the retina, and the painful sensation produced by a blow, are external *sensations*; the feeling of hunger and of restlessness are *internal sensations*. The external organs by which those impressions which cause sensation are primarily received, are called the organs of the senses; these are, the eye, the ear, the nose, the tongue, palate, &c., which constitute the organ of taste; and the extremities of nerves, dispersed under the common integuments, which give rise to the common sensation, feeling, or touch. The faculty of the mind by which we acquire the knowledge of bodies and their qualities, or perception, has been by some philosophers called *external sensation*; and those faculties by which we perceive novelty, sublimity, beauty, imitation, harmony, and ridicule, have been by some termed *secondary sensations*, by others *secondary senses*, and by others *emotions*.

SENSE, *n.* (sens.) [Fr. *sens*; from L. *sensus*, from *sentio*, to feel or perceive; W. *syniaw*, id.; *syn*, sense, feeling, perception; G. *sinn*, sense, mind, intention.] 1. The faculty by which animals perceive external objects by means of impressions made on certain organs of the body. The senses are those faculties by which we become acquainted with some of the conditions of our own bodies, and with certain properties and states of external things, such as their colour, taste, odour, size, form, density, motion, &c. The senses are five in number, namely, sight, hearing, taste, smell, and touch; and each of them is exercised in the recognition of an impression conveyed along some nerve to the brain. Not only are the fingers organs of touch, but every part of the body, and not only do sensations arise from the contact of other bodies, but from affections of the nerves and muscles, when no perceptible contact occurs. Indeed there are no kinds of sensation produced by external causes, which we may not also derive from conditions of the nerves, arising independently of such external causes; but the same internal cause acting on the organs of the several senses produces, through the medium of each, a sensation peculiar to itself, and similar in kind to that perceived in the exercise of that organ's normal function; so that a nerve of one sense, can in no case discharge the function of a nerve of any other sense. The great end of the senses, however, is to make us acquainted with external objects and their qualities, and our perception of these is accompanied with a belief that they exist, and are what they appear to be.—2. Sensation; perception by the senses.—3. Perception by the intellect; apprehension; discernment.

10. Meaning; import; signification; as, the true *sense* of words or phrases. In interpretation, we are to examine whether words are to be understood in a literal or figurative *sense*. So we speak of a legal *sense*, a grammatical *sense*, an historical *sense*, &c.—*Common sense*, that power of the mind which, by a kind of instinct, or a short process of reasoning, perceives truth, the relation of things, cause and effect, &c. and hence enables the possessor to discern what is right, useful, expedient or proper, and adopt the best means to accomplish his purpose. This power seems to be the gift of nature, improved by experience and observation.—*Moral sense*, a determination of the mind to be pleased with the contemplation of those affections, actions, or characters of rational agents, which are called good or virtuous.

Yet by a strange anomaly, the legislature, in recent times, has uniformly refused to give a complete divorce, (i. e. with leave to marry again), to any injured English wife, however great the wrongs sustained by her may have been: all that female complainants have yet obtained from parliament, after enormous expense incurred, has been a final *separation*.

To the attachment and bravery of the Sepoys, Great Britain is chiefly indebted for the possession of her Indian empire. This translation from the Hebrew is supposed to have been made in the reign and by the order of Ptolemy Philadelphus, king of Egypt, about two hundred and seventy or eighty years before the birth of Christ. It is supposed, however, by modern critics that this version of the several books is the work, not only of different hands, but of separate times. It is probable that at first only the Pentateuch was translated, and the remaining books gradually. The Septuagint was in use up to the time of our Saviour, and is that out of which most of the citations in the New Testament from the Old are taken. It is an invaluable help to the right understanding of the Hebrew Scriptures [Dr. Campbell supposes this version was so called because it was approved by the Sanhedrim.]

If *servus* originally was a slave, he was probably so named from being *preserved* and taken prisoner in war, or more probably from being bound, and perhaps from the Shemitic צור, *tzur*, צרר, *tzerar*, to bind. Large sums they reckoned by sestertia; that is, sums of a *thousand sertertii.* The coin itself was called *sestertius*, or *sestertius nummus*, or simply *nummus.* The sum of a thousand sestertii (about £8) was expressed by *mille sestertii*, or *M. sestertium*, or *M. nummi*, or *M. nummum*, or *nummorum*, or *M. sestertii nummi*, or *M. sestertium nummum.* The singular, *sestertium*, is never used alone for a thousand sestertii, but the plural, *sestertia*, for all multiples of a thousand sestertii, up to a thousand. One qualification of a Roman knight was the possession of estate of the value of four hundred thousand sesterces; that of a senator was double this sum. Authors mention also a copper *sesterce*, of the value of one third of a penny sterling. *Sesterce* was also used by the ancients for a thing containing two wholes and a half; the *as* being taken for the integer.

In *England*, the statutes 12 Richard II. and 19 Henry VII. seem to be the first rudiments of parish *settlements*. By statutes 13 and 14 Charles II. a legal *settlement* is declared to be gained by birth, by inhabitancy, by apprenticeship, or by service for forty days. But the gaining of a *settlement* by so short a residence produced great evils, which were remedied by statute 1 James II. A settlement in this case may be made either by deed or by will, but the term is most commonly applied to such settlements as are made by deed, and these may be either made upon valuable or good consideration, or they may be purely voluntary. The most important species of settlements are marriage settlements. In *Scots law*, in cases of bankruptcy, when the creditors agree to give the insolvent person a discharge in full, on his paying them a part, instead of the whole of the debt he owes them, this is termed a *settlement*.—*Disposition* and *settlement*. SEVEN, *a.* (sev'n.) [Sax *seofa, seofan;* G. *sieben;* L. *septem*, whence Fr. *sept*, Sans. *sapta;* Pers. *haft;* Gr. ἑπτα: Ar. *saba;* Heb. Ch. Syr. and Eth. שבע, *sheba*. In Ch. and Syr. סבע, *seba*, signifies to fill, to satisfy; in Ar. seven, and to make the number seven. In Heb. and Ch. שבע, *sheba*, is seven; Ar. *shabia*, to fill. With this orthography coincides the spelling of the Teutonic and Gothic words whose elements are *Sb*, or their cognates. But the Latin and Sanscrit have a third radical letter, as has the Persic, viz. *t*, and these coincide with the Ar. *sabata*, to observe the sabbath, to rest, Heb. Ch. and Syr. שבת, *shabath*. It is obvious then that *seven* had its origin in these verbs, and if the Persic and Greek words are from the same source, which is very probable, we have satisfactory evidence that the sibilant letter *s* has been changed into an aspirate. And this confirms an opinion that a similar change has taken place in the Gr. ἁλς, salt, W. *halen*, and in many other words.] Four and three; one more than six or less than eight. *Seven* days constitute a week. An instrument formed like a quadrant, excepting that its limb comprehends only 60 degrees, or the sixth part of a circle.

Sextant.

It is used for measuring the angular distances of objects by reflection. It is capable of very general application, but it is chiefly employed as a nautical instrument for measuring the altitudes of celestial objects, and their apparent angular distances. It is an instrument of the utmost importance in navigation. The principle of the sextant, and of reflecting instruments in general, depends upon an elementary theorem in catoptrics; viz., if an object be seen by reflection from two mirrors which are perpendicular to the same plane, the angular distance of the object from its image is double the inclination of the mirrors. The angle of inclination of the two mirrors, in the case of the sextant, is measured by means of a graduated arch or limb, and an index. The double of this angle gives the apparent altitude of the observed object. The sextant used at sea generally goes by the name of Hadley's sextant, or quadrant.—3. It is found that most plants are hermaphrodite, the male and female organs being contained in the same flower. This doctrine was taught, to a certain extent, by Theophrastus, Dioscorides, and Pliny among the ancients, but has been more fully illustrated by Cæsalpinus, Grew, Camerarius, Linnæus, and many others among the moderns

It attains a length of three feet, and is distinguished by the absence of sensible teeth, and by an irregular spot behind the gills. Two species of shad are found off the British coast; the *Twaite* and the *Allice shad,* Yarrel; but their flesh is dry and not much esteemed here. In the *U. The Gr. σκια is probably the same word contracted, and perhaps σκοτος, darkness. In the sense of cutting off or separating, this word coincides exactly, as it does in elements, with the G. *scheiden,* L. *scindo,* for *scido,* which is formed on *cædo,* to strike off. Hence Sax. *gescead,* distinction, L. *scutum,* a shield, Sp. *escudo;* that which cuts off or intercepts. Owen deduces the Welsh word from *cawd,* something that incloses; but probably the sense is that which cuts off or defends.] 1. Literally, the interception, cutting off, or interruption of the rays of light; hence, the obscurity which is caused by such interception. *Shade* differs from *shadow,* as it implies no particular form or definite limit; whereas a *shadow* represents in form the object which intercepts the light. Hence, when we say, let us resort to the *shade* of a tree, we have no reference to its form; but when we speak of measuring a pyramid or other object by its *shadow,* we have reference to its extent.—2. Darkness; obscurity; as, the *shades* of night. The *shade* of the earth constitutes the darkness of night.—3. An obscure place, properly in a grove or close wood, which precludes the sun's rays; and hence, a secluded retreat.

SHADE, *v. t.* [Sax. *sceadan, gesceadan,* to separate, to divide, to *shade.*] 1. SHAD'OW, *n.* [Sax. *scadu, sceadu.* *See* Shade.] 1. Shade within defined limits; obscurity or deprivation of light, apparent on a plane and representing the form of the body which intercepts the rays of light; as, the *shadow* of a man, of a tree or a tower. The *shadow* of the earth in an eclipse of the moon is proof of its sphericity. Shadow in *optics,* may be defined a portion of space from which light is intercepted by an opaque body. Every opaque object on which light falls is accompanied with a shadow on the side opposite to the luminous body, and the shadow appears more intense in proportion as the illumination is stronger. An opaque object illuminated by the sun, or any other source of light which is not a single point, must have an infinite number of shadows though not distinguishable from each other, and hence the shadow of an opaque body received on a plane is always accompanied by a *penumbra,* or partial shadow. In certain states of the atmosphere, the shadows of opaque objects projected on a white wall are frequently observed, about the time of sunset or sunrise, to be of a blue colour. — 2. Darkness; shade; obscurity.

It is also called the *fust*, or *trunk* of the column. It always diminishes in diameter, sometimes from the bottom, sometimes from a quarter, and sometimes from a third of its height, and sometimes it has a slight swelling, called the *entasis*, in the lower part of its height. In the Ionic and Corinthian columns, the difference of the upper and lower diameters of the shaft, varies from a fifth to a twelfth of the lower diameter. The *shakers*, who were at first called *shaking quakers*, from similarity of garb, take the name of the "millennial church." Their doctrines are a strange mixture of crude errors, intermixed with some gospel truths. Their devotional exercises are accompanied with dancing, or rather jumping, and singing. The members, male and female, lead a life of celibacy, and all the goods of the community, which is or has been a thriving one, are held and enjoyed in common. Bituminous shale is a subvariety of argillaceous slate, is impregnated with bitumen, and burns with flame. There are sandy, calcareous, purely argillaceous and carbonaceous shales.

SHALL, *v. i.* verb auxiliary. pret. *Should* [Sax. *scealan*, *scylan*, to be obliged. It coincides in signification nearly with *ought*, it is a duty, it is necessary; D. *zal*, *zul*; G. *soll*; Sw. *skola*, pret. *skulle*; Dan. *skal*, *skulle*, *skulde*. The German and Dutch have lost the palatal letter of the verb; but it appears in the derivative G. *schuld*, guilt, fault, culpability, debt; Sax. *scyld*, debt, offence, L. *scelus*. The literal sense is to hold or be held, hence to owe, and hence the sense of guilt, a being held bound or liable to justice and punishment. In the Teutonic dialects, *schulden*, *skyld*, are used in the Lord's prayer, as, "forgive us our debts," but neither *debt* nor *trespass* expresses the exact idea, which includes sin or crime, and liability to punishment. The word seems to be allied in origin to *skill*, L. *calleo*, to be able, to know. *See* SKILL. *Shall* is defective, having no infinitive, imperative, or participle. It ought to be written *shal*, as the original has one *l* only, and it has one only in *shalt* and *should.*] 1. *Shall* is primarily in the present tense, and in our mother tongue was followed by a verb in the infinitive, like other verbs. "*Ic sceal fram the beon gefullod,*" I *have need* to be baptized of thee; Matt. iii. "*Ic nu sceal singan sarcwidas,*" I must now sing mournful songs. We still use *shall* and *should* before another verb in the infinitive, without the sign *to*; but the signification of *shall* is considerably deflected from its primitive sense. It is now treated as a mere auxiliary to other verbs, serving to form some of the tenses. In the present tense, *shall*, before a verb in the infinitive, forms the future tense; but its force and effect are different with the different persons or personal pronouns. Thus in the first person, *shall* simply foretells or declares what will take place; as, I or we *shall* ride to town on Monday. This declaration simply informs another of a fact that is to take place. The sense of *shall* here is changed from an expression of need or duty, to that of previous statement or information, grounded on intention or resolution. When uttered with emphasis, "I *shall* go," it expresses firm determination, but not a promise.—2. In the second and third persons, *shall* implies a promise, command, or determination. "You *shall* receive your wages," "he *shall* receive his wages," imply that you or he *ought* to receive them; but usage gives to these phrases the force of a *promise* in the person uttering them. When *shall* is uttered with emphasis in such phrases, it expresses determination in the speaker, and implies an authority to enforce the act. "Do you refuse to go? Does he refuse to go? But you or he *shall* go."—3. *Shall I go, shall he go*, interrogatively, asks for permission or direction. But *shall you go*, asks for information of another's intention.—4. But after another verb, *shall*, in the third person simply foretells. He says that he *shall* leave town to-morrow. So also in the second person; you say that you *shall* ride to-morrow.—5. After *if*, and some verbs which express condition or supposition, *shall*, in all the persons, simply foretells; as,

If { I *shall* say, or we *shall* say,
Thou *shalt* say, ye or you *shall* say,
He *shall* say, they *shall* say.

6. *Should*, in the first person, implies a conditional event. "I *should* have written a letter yesterday, had I not been interrupted." Or it expresses obligation, and that in all the persons.

I *should*, } have paid the bill on demand; it was my duty,
Thou *shouldst*, } your duty, his duty to
He *should*, } pay the bill on demand,
You *should*, } but it was not paid.

7. *Should*, though properly the past tense of *shall*, is often used to express a contingent future event; as, if it *should* rain to-morrow; if you *should* go to London next week; if he *should* arrive within a month. In like manner after *though*, *grant*, *admit*, *allow*.

SIGN, *n.* (sine.) [Fr. *signe;* L. *signum;* Sax. *segen;* Arm. *sygn, syn;* Ir. *sighin;* G. *zeichen;* Sans. *zaga.* From the last three words it appears that *n* is not radical; the elements being *Sg.* If so, and the G. *zeichen* is of this family, then we learn that *sign* is only a dialectical orthography of *token,* for *zeichen* is the D. *teeken,* Dan. *tegn,* Sw. *tecken,* coinciding perhaps with Greek δεικνυμι.] 1. A token; something by which another thing is shown or represented; any visible thing, any motion, appearance, or event which indicates the existence or approach of something else. Thus we speak of *signs* of fair weather or of a storm, and of external marks which are *signs* of a good constitution.—2. A motion, action, nod, or gesture indicating a wish or command.

They made *signs* to his father, how he would have him called; Luke i.

10. In *astron.*, the twelfth part of the ecliptic. The signs are reckoned from the point of intersection of the ecliptic and equator at the vernal equinox, and are counted onwards, proceeding from west to east, according to the annual course of the sun, all round the ecliptic. In *printing*, they are represented by the following marks, which are attached to their respective names:—Aries ♈, Taurus ♉, Gemini ♊, Cancer ♋, Leo ♌, Virgo ♍, Libra ♎, Scorpio ♏, Sagittarius ♐, Capricornus ♑, Aquarius ♒, Pisces ♓. The first six signs, commencing with Aries, are called *northern signs,* because they lie on the north side of the equator: and the other six, commencing with Libra, are called *southern signs,* because they lie on the south side of the equator. The six beginning with Capricornus are called *ascending signs,* because the sun passes through them while advancing from the winter to the summer solstice, and is consequently acquiring altitude with respect to inhabitants of the northern hemisphere. The other six, beginning with Cancer, are called *descending signs,* because the sun in passing through them diminishes his altitude with respect to inhabitants of the northern hemisphere. [*See* ECLIPTIC.] These names are borrowed from the constellations of the zodiac of the same denomination, which were respectively comprehended within the foregoing equal divisions of the ecliptic, at the time when those divisions were first made, but on account of the precession of the equinoxes, the positions of these constellations in the heavens no longer correspond with the divisions of the ecliptic of the same name, but are considerably in advance of them. Thus the constellation Aries is now in that part of the ecliptic called Taurus.—11. In *alge.*, a character indicating the relation of quantities, or an operation performed by them; as the sign + [plus] prefixed to a quantity, indicates that the quantity is to be added; the sign — [minus] denotes that the quantity to which it is prefixed is to be subtracted. The former is prefixed to quantities called *affirmative* or *positive;* the latter to quantities called *negative.* The sign × [into] stands for multiplication, ÷ [divided by] for division, √ for the square root, ∛ for the cube root, $\sqrt[n]{}$ for the nth root, &c. The signs denoting a relation are, = equal to, > greater than, < less than, &c.—12. In *music,* any character, as a flat, sharp, dot, &c.—*Sign manual,* one's own name written by himself. [*See* No. 12.]—*Sign,* or *sign of the cross,* a ceremonial observance much in use among Roman Catholics and in the Greek church.

To *sign a paper, note, deed,* &c., is to write one's name at the foot, or underneath the declaration, promise, covenant, grant, &c., by which the person makes it his own act. To *sign one's name* is to write or subscribe it on paper. Signing does not now include sealing.—2.† To signify; to represent typically.—3. To mark.—4. SIG'NAL, *n.* [Fr. *signal;* from L. *signum.*] A sign that gives or is intended to give notice; or the notice given. Signals are used to communicate notice, information, orders, and the like, to persons at a distance, and by any persons and for any purpose. A signal may be a motion of the hand, the raising of a flag, the firing of a gun, or any thing which being understood by persons at a distance, may communicate notice. Signals are particularly useful in the navigation of fleets and in naval engagements. There are *day-signals,* which are usually made by the sails, by flags and pendants, or guns; *night-signals,* which are lanterns, disposed in certain figures, or false fires, rockets, or the firing of guns; *fog-signals,* which are made by sounds, as firing of guns, beating of drums, ringing of bells, &c. There are signals of evolution, addressed to a whole fleet, to a division, or to a squadron; signals of movements to particular ships; and signals of service, general or particular. Signals used in an army are mostly made by a particular beat of the drum, or by the bugle.

3. A mark for proof, or proof from marks.—4. Sign manual; the name of a person written or subscribed by himself.—5. Among *printers*, a letter or figure at the bottom of the first page of a sheet or half sheet, by which the sheets are distinguished and their order designated, as a direction to the binder. Every successive sheet has a different letter or figure, and if the sheets are more numerous than the letters of the alphabet, then a small letter is added to the capital one; thus A a, B b. In large volumes, the signatures are sometimes composed of letters and figures; thus 5 A, 5 B. But some printers now use figures only for signatures.—6. In *physiognomy*, an external mark or feature by which some persons pretend to discover the nature and qualities of a thing, particularly the temper and genius of persons.—7. In *music*, the flats and sharps placed after the clef at the beginning of the staff, which affect throughout the movement all notes of the same letter.—8. In *Scots law*, a writing prepared and presented by a writer to the signet to the Baron of Exchequer, as the ground of a Royal grant to the person in whose name it is presented; which having, in the case of an original charter the sign-manual of the sovereign, and in other cases the *cachet*, appointed by the act of union for Scotland, attached to it, becomes the warrant of a conveyance under one or other of the seals, according to the nature of the subject, or the object in view.

It is in the custody of the secretary of state for the home department. The *signet* in Scotland is the seal by which the king's letters and writs for the purpose of justice are now authenticated. Hence the title of *clerks to the signet*, or *writers to the signet*, whose business is nearly the same with that of attorneys in England. Their duty is to prepare the warrants of all charters of lands flowing from the crown; to sign all summonses for citing parties to appear in the court of session, and almost all diligences of the law for affecting the person or estate of a debtor, or for compelling implement of the decrees of the supreme court. They have further the privilege of acting as agents or attorneys in conducting causes before the court of session.—*Clerk of the signet*, an officer in England continually in attendance upon the principal secretary of state, who has the custody of the privy signet.

The *signification* of words was originally arbitrary, and is dependent on usage. But when custom has annexed a certain sense to a letter or sound, or to a combination of letters or sounds, this sense is always to be considered the *signification* which the person using the word intends to communicate. So by custom certain signs or gestures have a determined *signification*. Such is the fact also with figures, algebraic characters, &c.

Several are cultivated in gardens as ornamental flowers. *S. compacta* or close-flowered catch-fly, is one of the most beautiful of the genus. *S. inflata*, or bladder-catch-fly, possesses edible properties. SI'LEX, }
SIL'ICA, } *n.* [L. *silex*, flint.] Silicic acid, generally impure, as it is found in nature. This important substance constitutes the characteristic ingredient of a great variety of minerals; among which rock-crystal, quartz, chalcedony, and flint may be considered as silica nearly pure. It also predominates in many of the rocky masses which constitute the crust of our globe, such as granite, the varieties of sandstone, and quartz rock. It is the chief substance of which glass is made; also an ingredient, in a pulverized state, in the manufacture of stoneware, and it is essential in the preparation of tenacious mortar. Silex, when pure, is a fine powder, hard, insipid, and inodorous; rough to the touch, scratches and wears away glass. It combines in definite proportions with many salifiable bases, and its various compounds have been termed silicates. Plate glass and window glass, or, as it is commonly called, crown glass, are silicates of soda or potassa, and flint glass is a similar compound, with a large addition of silicate of lead. Recent experiments prove silica to be a compound substance, the base of which is a metal called silicium or silicon. Silica then is an oxide of silicium. [*See* SILICIC ACID.]

SIL'HOUETTE, *n.* (sil'ooet.) In the *fine arts*, a name given to the representation of an object filled in of a black colour, and in which the inner parts are sometimes indicated by lines of a lighter colour, and shadows or extreme depths by the aid of a heightening of gum or other shining medium. This sort of drawing derives its name from its inventor Etienne de Silhouette, the French minister of finance, in 1759.

SIL'ICATE, *n.* A salt composed of silicic acid and a base. Silicates formed by the union of silicic acid, or silica, with the bases alumina, lime, magnesia, potassa, soda, &c., constitute the greater number by far of the hard minerals which encrust the globe. The silicates of potash and soda, when heated to redness, form glass.

SIL'ICATED, *a.* Coated or mixed with flint.

SILIC'IC AC'ID, *n.* A name given to silica, because although it has none of the ordinary, or more obvious properties of an acid, it combines with many salifiable bases, and expels carbonic acid when fused with the carbonated alkalies. According to Thomson, it is composed of one equivalent of silicium or silicon, and one of oxygen; or, according to Berzelius, one of silicium, or silicon, and three of oxygen.

SILICICALCA'REOUS, *a.* [*silex* and *calcareous*.] Consisting of silex and calcareous matter.

SILICICAL'CE, *n.* [L. *silex* or *silica* and *calx*.] A mineral of the silicious kind, occurring in amorphous masses; its colour is gray or brown. It is a mixture of flint and carbonate of lime.

SILIC'IUM, }
SIL'ICON, } *n* [L. *silex*, flint.] The base of silica, a dark, nut-brown elementary substance, destitute of a metallic lustre. It is probably not metallic, as has been supposed. It bears a greater analogy to boron than any known principle. It is a non-conductor of electricity, incombustible in air and oxygen, infusible by the blow pipe, and not acted upon by any single acid; but it is readily soluble in a mixture of the nitric and hydrofluoric acids. Its external characters are much altered after exposure to a high temperature.

SIL'ICLE, }
SILI'CULA, } *n.* [L. *silicula*.] In *bot.*, a kind of fruit. In its structure it resembles the siliqua, and differs in nothing but its figure, which is rounded and much shorter, and in the number of its seeds. It is never more than four times as long as broad, and often much shorter. Examples of it may be seen in the whitlow-grass,

in the shepherd's purse, and in the horse radish. [*See* SILIQUA.]

Silicula.

SIL'ICO-FLUORIC ACID, *n.* When silicic acid is dissolved by hydrofluoric acid a gas is produced which is colourless, fuming strongly in the air. It is absorbed by water, and hydrated silicic acid is deposited, while an acid is found in the water, which is termed *silico-fluoric acid.* With bases this acid forms salts called *silico-fluorides*, which are nearly all insoluble.

SILICULO'SA, *n.* One of the two orders into which Linnæus divided his class Tetradynamia. It comprehends those plants which have a silicle. [*See* SILICLE.]

The seeds are attached to two placentæ, which adhere to the replum, and are opposite to the lobes of the stigma. This kind of seed-vessel is possessed by a large number of plants belonging to the order Cruciferæ, and examples may be seen in the stock or wall-flower, in the ladies' smock, and in the cabbage, turnip, and mustard.

SILK, *n.* [Sax. *seolc;* Sw. *silke;* Russ. *schilk;* properly any thread, from Ar. *salaka*, to send or thrust in, to insert, to pass or go.] 1. The fine, soft thread produced by the larva of the insect called *silk-worm* or *Bombyx Mori.* That which we ordinarily call *silk*, is a thread composed of several finer threads, which the worm draws from its bowels, like the web of a spider, and with which the silk-worm envelopes itself, forming what is called a *cocoon. Raw silk* is produced by the operation of winding off, at the same time, several of the balls or cocoons (which are immersed in hot water to soften the natural gum on the filament) on a common reel, thereby forming one smooth even thread. Before it is fit for weaving it is converted into one of three forms,—viz., *singles, tram*, or *organzine. Singles* (a collective noun) is formed of one of the reeled threads, being twisted in order to give it strength and firmness. *Tram* is formed of two or more threads twisted together. In this state it is commonly used in weaving, as the *shoot* or *weft. Thrown silk* is formed of one, two, three, or more singles, according to the substance required, twisted together in a contrary direction to that in which the singles of which it is composed are twisted. This process is termed *organzining*, and the silk so twisted *organzine.*—2. Cloth made of silk. In this sense, the word has a plural, *silks*, denoting different sorts and varieties, as black *silk*, white *silk*, coloured *silks.* —*Virginia silk*, a plant of the genus Periploca, which climbs and winds about other plants, trees, &c.

the salmons. The family Siluridæ constitutes a very extensive section of fishes, the species of which are, for the most part, confined to the fresh waters of warm climates. They present great diversity of form, but their most obvious external characters are the want of true scales: the skin is generally naked, but in parts protected by large bony plates; the foremost ray of the dorsal and pectoral fins almost always consists of a strong bony ray, often serrated either in front or behind, or on both sides. The mouth is almost always provided with barbules. The only known European species of Silurus is the *Silurus glanis*, Linn., a fish of a very large size, which is found in the lakes of Switzerland, in the Danube, the Elbe, and all the rivers of Hungary. SIL'VER, *n.* [Sax. *seolfer*, *siluer*; G. *silber*; Sw. *silfver*. Qu. Russ. *serebro*; *r* for *l*.] 1. A metal of a white colour and lively brilliancy. It has neither taste nor smell; its specific gravity is 10.552, according to Bergman, but according to Kirwan it is less. A cubic foot weighs about 660 lbs. Its ductility is little inferior to that of gold. It is harder and more elastic than tin or gold, but less so than copper, platinum, or iron. It is superior to gold in lustre, but inferior to it in malleability; it is, however, so malleable that it may be beaten into leaves not exceeding the 100,000th part of an inch in thickness. It is not altered by air or moisture, but is blackened or tarnished by sulphuretted hydrogen. The only pure acids which act upon silver are the nitric and sulphuric. It is found native in thin plates or leaves, or in fine threads, or it is found mineralized by various substances; it is also found in the state of sulphuret, constituting the varieties of black and vitreous silver ore. It likewise occurs in combination with several other metals, and more especially with the sulphurets of lead. Great quantities of this metal are furnished by the mines of South America, and it is found in small quantities in Norway, Germany, Spain, the United States, &c. The numerous uses and applications of silver are well known. In its pure state it is too soft for coin, plate, and most ornamental purposes, and is therefore in such cases alloyed with copper, by which, in proper proportion, its colour is not materially impaired, and it is considerably hardened. The standard silver of our coin is an alloy of 11 oz. 2 dwts. of pure silver, and 18 dwts. of copper to the pound Troy, and this weight is coined into 66 shillings.—*German silver*, an alloy of copper, zinc, and nickel, which is now extensively used as a substitute for silver for ornamental purposes.—2. SIN, *n.* [Sax. *sin* and *syn;* G. *sünde;* Lapponic, Finnish, *sindia;* allied perhaps to Ir. *sainim*, to alter, to vary, to *sunder.* The primary sense is probably to depart, to wander.] 1. The voluntary departure of a moral agent from a known rule of rectitude or duty, prescribed by God; any voluntary transgression of the divine law, or violation of a divine command; a wicked act; iniquity. Sin is either a positive act in which a known divine law is violated, or it is the voluntary neglect to obey a positive divine command, or a rule of duty clearly implied in such command. Sin comprehends not actions only, but neglect of known duty, all evil thoughts, purposes, words, and desires, whatever is contrary to God's commands or law; 1 John iii.; Matt. xv.; James iv.

> Sinners neither enjoy the pleasures of *sin*, nor the peace of piety. *Rob. Hall.*

Among divines, sin is *original* or *actual.* *Actual* sin, above defined, is the act of a moral agent in violating a known rule of duty. *Original* sin, as generally understood, is native depravity of heart; that want of conformity of heart to the divine will, that corruption of nature or deterioration of the moral character of man, which is supposed to be the effect of Adam's apostasy; and which manifests itself in moral agents by positive acts of disobedience to the divine will, or by the voluntary neglect to comply with the express commands of God, which require that we should love God with all our heart and soul and strength and mind, and our neighbour as ourselves. This native depravity or alienation of affections from God and his law, is supposed to be what the apostle calls the *carnal mind* or *mindedness*, which is enmity against God, and is therefore denominated *sin* or *sinfulness.*—*Unpardonable sin*, or blasphemy against the Holy Spirit, is supposed to be a malicious and obstinate rejection of Christ and the gospel plan of salvation, or a contemptuous resistance made to the influences and convictions of the Holy Spirit; Matt. xii.—2. A sin-offering; an offering made to atone for sin.

> He hath made him to be *sin* for us, who knew no sin; 2 Cor. v.

3.† A man enormously wicked. [*Sin* differs from *crime*, not in nature, but in application. That which is a *crime* against society, is *sin* against God.]

SIN, *v. i.* [Sax. *singian, syngian.*] 1. To depart voluntarily from the path of duty prescribed by God to man; to violate the divine law in any particular, by actual transgression, or by the neglect or non-observance, of its injunctions; to violate any known rule of duty.

> All have *sinned* and come short of the glory of God; Rom. iii.

It is followed by *against.*

> *Against* thee, thee only, have I *sinned;* Ps. li.

2. To offend against right, against men or society; to trespass.

> I am a man
> More *sinn'd* against than *sinning.* *Shak.*

It is soluble in hot water and alcohol, and crystallizes in shining, fatty, fusible scales. It combines with acids, and is separated from them by ammonia. It is a compound of 14 equivalents of carbon, 12 of hydrogen, 2 of nitrogen, and 2 of oxygen.

SIN'BORN, *a.* Derived from sin.

SINCE, *prep.* or *adv.* [Sw. *sedan;* D. *sint;* supposed to be contracted from Sax. *siththan*, which is from *sithian*, to pass, to go; and *siththan* may be the participle, and denote past, gone, and hence after, afterward. *Sith* in Saxon, has a like sense. Our early writers used *sith, sithen, sithence;* the latter is evidently a corruption of *siththan.* It may be doubted whether Sw. *sen*, Dan. *seen*, slow, late, is a contraction of this word; more probably it is not.] 1. After; from the time that. The proper signification of *since* is *after*, and its appropriate sense includes the whole period between an event and the pre-

sent time. I have not seen my brother *since* January.

The Lord hath blessed thee, *since* my coming; Gen. xxx.

Holy prophets, who have been *since* the world began; Luke i.; John ix.

Since then denotes, during the whole time after an event; or at any particular time during that period.—2. Ago; past; before this. "About two years *since*, an event happened," that is, two years having *passed*.—3. Because that; this being the fact that.

Since truth and constancy are vain,
Since neither love nor sense of pain,
Nor force of reason can persuade,
Then let example be obey'd. *Glanville.*

Since, when it precedes a noun, is called a preposition, but when it precedes a sentence it is called an adverb. The truth is, the character of the word is the same in both cases. It is probably an obsolete participle, and according to the usual classification of words, may be properly ranked with the prepositions. In strictness, the last clause of the passage above cited is the case absolute. "The Lord hath blessed thee, *since my coming*," that is, my arrival being *past*. So, *since the world began*, is strictly, *past* the world began, the beginning of the world being *past*. In the first case, *since*, considered as a preposition, has *coming*, a noun, for its object, and in the latter case, the clause of a sentence. So we say, *against* your arrival, or *against* you come. — *Since* is considered by many grammarians as a conjunction when taken to signify because that, seeing, or seeing that.

I would have all gallicisms avoided, that our tongue may be *sincere*. *Felton.*

SY'PHON, } σιφων; Fr. *siphon*; Qu. from the root of *sip.*] 1. A bent pipe or tube whose legs are of unequal length, used for drawing liquor out of a vessel by causing it to rise over the rim or top. For this purpose, the shorter leg is inserted in the liquor, and the air is exhausted by being drawn through the longer leg (*See* fig. 1.) The liquor then rises by the weight of the atmosphere to supply the vacuum, till it reaches the top of the vessel, and then descends in the longer leg of the siphon, and continues to flow till the vessel be emptied. The action of the siphon depends on the difference between the lengths of the two legs, estimated in a perpendicular direction, the shorter leg being always inserted in the liquid. Sometimes an exhausting tube is placed on the longer leg for exhausting the air by suction, (*see* fig. 2,) and causing the flow to commence, but the more general method is to fill the tube in the first place with the liquid, and then stopping the mouth of the longer leg, to insert the shorter leg in the vessel; upon removing the stop the liquid will immediately begin to flow. The limits within which the siphon can act, are determined by the specific gravity of the fluid. Water cannot be raised by the siphon to a greater height than 34 feet, nor mercury to a greater height than 30 inches.—*Würtemberg siphon,* (so called from its having been first used at that place), a siphon with both legs equal, and turned up at the extremities; in which case, so long as the extremities are kept on the same level, it will continue always full and ready for use.

of railways skew bridges were seldom erected, it being more usual to build the bridge at right angles, and to divert the course of the road or the stream to accommodate it. But in a railway, and sometimes in a canal, such a deviation from the straight line of direction is inadmissible, and it therefore becomes necessary to build the bridge obliquely. — *Skew arch*, an oblique arch,—*which see*.

In Heb. סכל, *sakal*, is foolish, perverse, and as a verb, to pervert, to be foolish or perverse; in Ch. to understand or consider, to look, to regard, to cause to know, whence knowledge, knowing, wise, wisdom, understanding; Rab. to be ignorant or foolish; Syr. to be foolish, to wander in mind, also to cause to understand, to know, to perceive, to discern, also to err, to do wrong, to sin, to fail in duty; whence foolish, folly, ignorance, error, sin, and understanding; Sam. to be wont or accustomed, to look or behold. The same verb with, ש, Heb. שכל, *sakal*, signifies to understand, to be wise, whence wisdom, understanding, also to waste, to scatter or destroy, to bereave, also to prosper; Ch. to understand; שכלל, *shakelel*, to complete, to perfect; כלל, *kalal*, with a prefix. This signifies also to found, to lay a foundation; Syr. to found, also to finish, complete, adorn, from the same root; Ar. *shakala*, to bind or tie, whence Eng. *shackles;* also to be dark, obscure, intricate, difficult, to form, to make like, to be of a beautiful form, to know, to be ignorant, to agree, suit, or become. The sense of folly, error, sin, perverseness, is from wandering, deviation, Gr. σκολιος: the sense of *skill* and understanding is from separation, discernment, or from taking, holding, or reaching to, for strength and knowledge are allied, and often from tension. The sense of ignorance and error is from wandering or deviation, or perhaps it proceeds from a negative sense given to the primary verb by the prefix, like *ex* in Latin, and *s* in Italian. The Arabic sense of binding and shackles is from straining. The Eng. *shall* and *should* belong to this family.] 1. SLEEP, *n.* A natural and healthy, but temporary and periodical suspension of the functions of the hemispheres of the cerebrum, or in other words, of the intellectual powers. Sleep may be complete or incomplete. That state of an animal in which the voluntary exertion of his mental and corporeal powers is suspended, and he rests unconscious of what passes around him, and not affected by the ordinary impressions of external objects. Sleep is generally attended with a relaxation of the muscles, but the involuntary motions, as respiration and the circulation of the blood, are continued. The mind is often very active in imperfect sleep, but its powers not being under the control of reason, its exercises are very irregular. Sleep is the natural rest or repose intended by the Creator to restore the powers of the body and mind, when exhausted or fatigued The quantity of sleep required by different individuals is various, from six to nine hours being the average proportion, but persons of very active dispositions and abstemious habits will be satisfied with four or five hours.—2. Slumber; rest; repose.—3. Death; rest in the grave.—*Sleep of plants*, a state of plants at night when their flowers close, the leaves become more erect, and fold themselves together, while vitality seems to retire from the periphery. This is chiefly owing to the withdrawal of the stimulus of light to which they are subjected during the day. With the approach of night, too, an important change takes place in the functions of plants, for instead of exhaling oxygen and absorbing carbon from the atmosphere, as, during the day, their action at night is directly the reverse. There are also plants, which, like certain animals, sleep through the day and are awake at night; and it has been ascertained that the leaves of plants kept constantly in the dark, open and close at regular intervals, as during sleep; so that there must be some cause of the sleep of plants, more intimately connected with their organization, than the mere withdrawal of light.

both of South America. These animals are so called from the slowness of their motions on the ground, which is the necessary consequence of their disproportioned structure. They live on trees, and never remove from the one they are on until they have stripped it of every leaf. The sloths are exceedingly helpless when on the ground, and move with great difficulty; and hence the accounts of their slowness have been greatly exaggerated. They seem at home only when upon trees, resting or moving suspended beneath their branches, and are sometimes observed to travel from tree to tree, and along branches, with considerable celerity. The female produces but a single young one at a birth; which she carries on her back.

In a limited sense, this term is almost confined to the sliding gates commonly used in mill-streams, ponds, sewers, &c., to retain the water when necessary, or to allow it to escape in any required quantity, such gates being usually raised and lowered by means of a rack and pinion attached to the upper parts of the frame in which they slide. In a more extended application of the term, it embraces all kinds of floodgates, flaps, and other apparatus, used to stop, collect, or to retain water, and to let it off as occasion requires. According to this use of the word, a canal-lock may be considered as a double sluice. Sluices are extensively used in most hydraulic works, and exhibit great variety in their construction, according to the purposes which they are intended to serve. In mill-streams, they serve to keep back the water when the mill is at rest, and to regulate the supply, when the mill is going. They also act as wasters to allow the surplus water of a pond or reservoir to escape. Various self-acting sluices have been contrived for mill-streams, &c., to avoid the inconvenience and danger which might result from neglect, as well as to save the expense of a sluice-keeper.—2. SMELL, *n.* The sense or faculty by which certain qualities of bodies are perceived through the instrumentality of the olfactory nerves; or the faculty of perceiving by the organs of the nose; one of the five senses. The essential part of the organ of smell consists of the expansion of the olfactory nerves, the first or most anterior of the nerves from the brain, whose minutest branches are distributed just beneath the mucous part of the nose. The air, passing through the nose, brings the effluvia or odoriferous particles of bodies into contact with the olfactory nerves, the nerves transmit the impression to the brain, by means of which it is perceived by the mind. The human organ of smell is less developed than that of other mammalia, or even of birds. In different animals the sense of smell is adapted chiefly to that class of substances on which they feed. In the choice of food, which is the main object of the sense of smell, man generally, though almost unconsciously, and animals always, exercise the precaution of smelling, and they instinctively form a judgment according to the impression received. In eating also, much of that which is commonly attributed to the sense of taste, depends upon the odour of the food carried from the mouth to the nose. In some species of beasts, the *smell* is remarkably acute, particularly in the canine species.—2. Scent; odour; the quality of bodies which affects the olfactory organs; as, the *smell* of mint; the *smell* of geranium.

SMELT'ING, *n.* The operation by which the ores of iron, copper, lead, &c., are reduced to the metallic state by fusion. This operation requires to be conducted differently according to the different metallic ores. In regard to iron, the ore, after having been *roasted* or calcined in a kiln, in order to drive off the water, sulphur, and arsenic, with which it is more or less combined in its native state, is subjected to the heat of a blast furnace, along with certain proportions of coke and limestone, which latter serves as a flux. The furnace is charged with the materials from the top, and these being set fire to at the bottom, are allowed to burn, the combustion being afterwards accelerated by a blast from a blowing machine, the blast pipes of which are made to enter near the bottom of the furnace. The ore, coke, and limestone in the body of the furnace are acted upon by the heat, just as they would be in a close vessel, the oxygen of the ore combining with the carbon of the coke, and forming carbonic oxide, and thus gradually reducing the ore to the metallic state. The liquid metal, as it is thus formed, falls down to that part of the bottom of the furnace called the hearth, where there is an opening in the wall, at the mouth of which a stone is placed called the *dam stone*. Beyond this, an opening is made in the side of the outer wall, in order to run off the metal, when collected in sufficient quantity. On opening this hole, the metal is allowed to run off into a channel made in a kind of sand. From this channel, called the *sow*, numerous side channels are led, called *pigs*, and as the melted metal flows along the sow, it is frequently checked by the workmen, and made to flow into the side channels, and thus the masses of iron called *pig iron* are formed, the masses formed in the main channel being termed *sow iron*.

The exhalation, visible vapour, or substance that escapes or is expelled in combustion from the substance burning. It is particularly applied to the volatile matter expelled from vegetable matter, or wood, coal, peat, &c. The matter expelled from metallic substances is more generally called *fume*, *fumes*. In its more extended sense, the word smoke is applied to all the volatile products of combustion, which consist of gaseous exhalations charged with minute portions of carbonaceous matter, or soot; but, as often used in reference to what are called smoke-consuming furnaces, the term is frequently employed to express merely the carbonaceous matter which is held in suspension by the gases. Various methods have been devised for the removal of smoke or for the cure of smoky chimneys, and also for the consumption and purification of smoke. The methods employed for the latter purpose all merge into one common principle; namely, that of mixing air with the combustible vapours and gases generated by the action of heat on pit coal, so that they may be made to burn with flame, and become entirely converted into incombustible and transparent invisible vapours and gases.—2. Frozen vapour; watery particles congealed into white crystals in the air, and falling to the earth. Snow is formed in the air, when the temperature of the atmosphere sinks below the freezing point. The particles of moisture contained in the atmosphere are then frozen, and form flakes, which descend to the earth. These have great diversities of density, and display innumerable varieties of the most beautiful forms. Generally speaking, when examined by the microscope, they present modifications of stelliform and hexagonal crystals; and frequently they consist of a star of six rays, formed of prisms united at angles of 60°, from which other prisms shoot

Crystals of Snow.

at similar angles, giving the whole an appearance of exquisite beauty and great regularity. Sometimes, however, snow presents no traces of crystallization, but falls in a fine powder; and in this case it is supposed to have been formed near the surface of the earth. The bulk of new-fallen snow is about ten or twelve times greater than that of the water obtained by melting it. Snow answers many valuable purposes in the economy of nature. Accumulated upon high regions, it serves to feed, by its gradual melting, streams of running water, which a sudden increase of water, in the form of rain, would convert into destructive torrents or standing pools; and in many countries it tempers the burning heats of summer by cooling the breezes which pass over it. In severer climates it serves as a defence against the rigours of winter, by protecting vegetation from the frost, and by affording a shelter to animals which bury themselves under it. Even in more temperate climates it is found that vegetation suffers more from an open winter than when the fields, during that season, lie hid beneath a snowy covering; for as snow is a slow conductor of heat, a coating of it prevents the earth from parting quickly with its warmth, and at the same time protects it from the cold of the atmosphere.—*Red*

snow, snow of a red tint, which appears to be met with in all parts of the world. The colouring matter of this substance is not clearly ascertained, some considering it to proceed from a species of red algæ, *Protococcus nivalis*, and others referring it to the presence of an animalcule, *Philodina roseola*, and others again refer it to both of these causes. [*See* HAIL.]—2. A vessel equipped with two masts, resembling

On its first arrival in this country it is very lean, but quickly grows fat, and is then excellent eating. It sings very sweetly, sitting on the ground; and does not perch, but runs about like the lark. Several other birds which make their appearance in winter are popularly called *snow-birds;* as, the *Fringilla nivalis* of Europe and the *Fringilla hiemalis* of America.

SNŌW-LINE, *n.* The limit of perpetual snow, or the elevation at which mountains are covered with perpetual snow. As the temperature of the atmosphere continually diminishes, as we ascend, from the lower into the higher strata, there must be in every latitude a certain limit of elevation at which the temperature of the air is reduced to the freezing point. This limit is called the snow line, or line of perpetual congelation, and the mountains which rise above it are always covered with snow. The *snow line* varies according to latitude, being highest near the equator and lowest near the poles. Local circumstances also affect it, as the configuration of the country, the quantity of snow falling annually, &c. From these circumstances, the snow line is at different heights in the same latitude, and the fact of a mountain being perpetually covered with snow is no sure indication of its height.

SNŌW-PLOUGH, *n.* A simple machine, operating like a plough, but upon a much larger scale, for clearing away the snow from roads. It usually consists of boards framed together, so as to form an acute angle in front, and spread out behind to any required distance. The angular point or edge is made to enter the snow, and the machine being propelled by horses harnessed to the centre framework, the snow is thrown off by the boards to the sides of the road, and thus a free passage is opened up for wheel-carriages, &c. The same name is given to an instrument or machine to be driven before a locomotive, for throwing snow from a railway and clearing the rails.

There are many different kinds of soaps, but those commonly employed may be divided into three classes; 1. Fine white soaps, scented soaps, &c.; 2. Coarse household soaps; 3. Soft soaps. White soaps are generally combinations of olive oil and carbonate of soda. Perfumes are occasionally added; or various colouring matters stirred in while the soap is semifluid. Common household soaps are made chiefly of soda and tallow. Yellow soap is composed of tallow, resin, and soda, to which some palm oil is occasionally added. Soft soaps are generally made with potash instead of soda, and fish-oil with the addition of a little tallow. Excellent soaps are made from palm-oil and soda. Soap is soluble in pure water and in alcohol; the latter solution jellies when concentrated; and is known in medicine under the name of *opodeldoc*, and when evaporated to dryness, it forms what is called trans-

parent soap. The earths and common metallic oxides form insoluble soaps, which possess no detergent power.

SOCIOL'OGY, *n.* [L. *socius*, a companion, and Gr. λογος, discourse] Social science, or the science of society, according to the Positive Philosophy of M. Compte. It treats of the general structure of human society, the laws of its development, and the progress of actual civilization. Sociology is the most complex of all the sciences, and consists of derivative truths, verified by experience from psychology and the laws of ethology, or the science of the formation of character. The laws of social phenomena are nothing but the laws of the thoughts, feelings, and actions of men united together in the social state; and these laws are approximate generalizations obtained from the past history and present observation of all stages of civilization. And as men's thoughts, feelings, and actions are subject to fixed laws, that is, uniform sequences, so must also the phenomena of society, that is, of aggregates of men. The fundamental problem of society is to discover the laws by which any state of society produces the state which follows it, and takes its place, and to show by deduction that these laws are derivative from those of human nature. The subject matter of the sciences of man, and of society, is peculiar in varying from age to age, and in being progressive. The laws of human nature, and of the external circumstances in which men are placed, form their characters, and men themselves in turn mould and shape circumstances for themselves and their posterity. The institutions of a people are the results of their ideas, and as society advances, mental qualities tend more and more to prevail over bodily, and aggregates of men over individuals. The elements of permanent social union are education through life, which is always a restraining discipline, the feeling of allegiance or loyalty to something fixed and permanent, and a strong and active principle of nationality or union for common interest. Such are some of the leading principles of sociology; but to understand the science aright, it is necessary to have recourse to M. Compte's great work entitled "*Cours de Philosophie Positive*," and the last book of Mill's System of Logic.

SOCRAT'ICAL, } crates the Grecian sage, or to his language or manner of teaching and philosophizing. The *Socratic* method of reasoning and instruction was by interrogatories. Instead of laying down a proposition authoritatively, this method led the antagonist or disciple to acknowledge it himself by dint of a series of questions put to him. It was not the object of Socrates to establish any perfectly evolved system of doctrine, so much as to awaken by his discourses a new and more comprehensive pursuit of science, which should direct itself to all that is knowable. To him is ascribed two of the very first principles of science, namely, the inductive method and the definition of ideas.

SO'DA, *n* [G. *soda;* Sp. *soda* or *sosa*, glasswort, barilla.] 1. The protoxide of the metal sodium, formerly called, though not appropriately, mineral alkali. It has likewise been called a fixed alkali, in contradistinction from ammonia, which is a volatile alkali. Soda, or protoxide of sodium, is formed when sodium is burned in dry air or oxygen. It is a white powder, which attracts moisture and carbonic acid from the air. It consists of one equivalent of sodium, and one of oxygen. When this protoxide is dissolved in water, there is formed the true alkali, or hydrate of soda, called also caustic alkali. It is a white brittle mass of a fibrous texture, having a specific gravity of 1·536. It has a most corrosive taste and action upon animal substances, dissolving readily both in water and

alcohol, attracting carbonic acid from the atmosphere, and falling thereby into an efflorescent carbonate. It forms soaps with tallow, oils, wax, rosin; dissolves wool, hair, silk, horn, alumina, silica, sulphur, and some metallic sulphurets. It consists of 77·66 soda and 22·34 water. With acids, soda forms salts which are soluble in water, and many of which crystallize. The carbonate of soda is the soda of commerce in various states, either crystallized, in lumps, or in a crude powder called soda-ash. The soda of commerce is supplied chiefly from two sources, the burning of marine vegetables, such as common seaweed, and the *salsola soda*, which furnish the impure alkalies called *kelp* and *barilla;* and the decomposition of common salt, or rather, perhaps, the sulphate of soda, obtained by the decomposition of salt, by sulphuric acid. The chief uses of soda are in the manufacture of glass, and of hard soap. The carbonate of soda is used in washing, and is a powerful detergent, although milder than carbonate of potash. It is also used in medicine. Sulphate of soda is glauber salts. [*See* SODIUM.]

SO'DA POWDERS, *n.* A substitute for soda-water. They are usually put up in blue and white papers; the former containing half a drachm of carbonate of soda and the latter 25 grains of tartaric acid. These are separately dissolved in water, and the solutions mixed and drunk while effervescing. The mixture, however, forms a tartarate of soda, and not a carbonate, as in the case of soda-water.

SO'DA-WATER, *n.* A refreshing drink formed by dissolving carbonate of soda in water, and supersaturating it with carbonic acid under pressure. It is useful in cases of debility of the stomach, accompanied with acidity.

SOD'DED, *pp.* Covered with sod; turfed.

SOD'DY, *a.* [from *sod.*] Turfy; consisting of sod; covered with sod.

SO'DIUM, *n.* The metallic base of soda, discovered by Davy in 1807. He obtained it by a process exactly similar to that by which he procured potassium, which it strongly resembles in many properties. Gay-Lussac and Thénard soon afterwards procured it in greater quantity by decomposing soda by means of iron. Sodium is a silver-white metal, having a very high lustre. It has not the bluish tinge of potassium, but, if any, rather a very slight yellowish tint, so that it resembles silver, while potassium resembles mercury. Its specific gravity is 0·9348; it melts at 200°, being rather less fusible than potassium, but it is on the other hand somewhat more volatile. It rapidly attracts oxygen from the air, and must therefore be kept under naphtha. It decomposes water instantly, but does not spontaneously take fire when thrown on water, as potassium does. When heated in air or oxygen it takes fire and burns with a very pure and intense yellow flame. It is perhaps more abundant in our globe than any other metal, for it constitutes ⅖ of all the sea salt existing in sea-water, in the water of springs, rivers, and lakes, in almost all soils, and in the form of rock-salt. Sea-salt is a compound of chlorine with sodium. Sodium also occurs as oxide of sodium or soda, in a good many minerals; and more especially in the form of carbonate, nitrate, and borate of soda. Soda is contained in sea plants, and in land plants growing near the sea. It occurs also in most animal fluids. The only important oxide of sodium is the protoxide. [*See* SODA.]

3. [Lat. *solum*, W. *swl.*] The upper stratum of the earth; the mould, or that compound substance which furnishes nutriment to plants, or which is particularly adapted to support and nourish them. Wherever the surface of the earth is not covered with water, or is not naked rock, there is a layer of earth more or less mixed with the remains of animal and vegetable substances in a state of decomposition, which is commonly called the *soil*. Soils may generally be distinguished from mere masses of earth by their friable nature and dark colour, and by the presence of some vegetable fibre or carbonaceous matter. In uncultivated grounds, soils generally occupy only a few inches in depth on the surface; and in cultivated grounds their depth is generally the same as that to which the implements used in cultivation have penetrated. The stratum which lies immediately under the soil is called the subsoil, which is comparatively without organized matter. Soil is composed of certain mixtures or combinations of the following substances: The earths, silex, alumina, lime, magnesia; the alkalies, potassa, soda, and ammonia, oxide of iron and small portions of other metallic oxides, a considerable proportion of aqueous moisture, and several gases, as oxygen, hydrogen, carbonic acid. Besides these every soil contains vegetable and animal matters, either partially or wholly decomposed. The analyzing of soils, in order to ascertain their component parts, and qualities, and their adaptation to the growth of various vegetable productions, as well as the methods of improving them by means of chemical manures, form the subject of agricultural chemistry. SOLD'ERING, *n.* The process of uniting the surfaces of metals, by the intervention of a more fusible metal, which being melted upon each surface, serves, partly by chemical attraction, and partly by cohesive force, to bind them together. The alloy used as a solder must not only be more fusible than the metal or metals to be united, but must also have a strong affinity for them. The solder usually contains a large proportion of the metal to which it is to be applied, in combination with some more easily fusible metal. The surfaces to be united must be made perfectly clean and free from oxide. This is commonly effected by scraping the surfaces; and in order that the formation of any oxide may be prevented during the process, borax, sal ammoniac, or rosin is used, either mixed with the solder or applied to the surfaces. A new process of soldering, the invention of a French gentleman, has recently been introduced under the name of *autogenous soldering.* It consists in the union of two pieces of metal without the intervention of any solder, by fusing them at the point of junction, by jets of flame from a gas blowpipe.

SOL'ID, *a.* [L. *solidus;* Fr *solide;* from the sense of *setting* or *pressure*, and hence allied to L. *solum*, Eng. *sill.*] 1. Hard; firm; compact, not fluid; not superficial; having its constituent particles so connected together that their relative positions cannot be altered without the application of sensible force. The force which resists the alteration of the relative positions of the parts, is termed the force of cohesion. Hence solid bodies are distinguished from fluids, whose parts yield, and alter their relative positions on the application of the slightest force or impression. [See the noun.] *Solid* is opposed to *fluid* and *liquid.*—2. Not hollow; full of matter; as, a *solid* globe or cone, as distinguished from a *hollow* one.—3. The algebraic solution of a solid problem leads to a cubic or biquadratic equation.—*Solid of least resistance.* [*See* RESISTANCE.]
SOL'ID, *n.* A firm compact body, a body the cohesion of whose particles is so strong that they move in a combined mass, and retain their relative positions. A solid is thus distinguished from a liquid, whose parts or particles yield to the slightest impression, and are easily made to move amongst each other. In solids, the attractive forces of the particles are greater than the repulsive, and the particles consequently adhere with greater or less force; in liquids, the attractive and repulsive forces are balanced; and in gases the repulsive forces prevail.—2. In *geom.*, a body or magnitude which has three dimensions; length, breadth, and thickness, being thus distinguished from a surface which has but two dimensions, and from a line, which has but one. The boundaries of solids are surfaces.—*Regular solids* are those which are bounded by equal and regular planes. SOLU'TION, *n.* [Fr.; from L. *solutio*, from *solvo*, to loosen, melt, dissolve. *See* SOLVE.] 1. The act of separating the parts of any body; disruption; breach.—2. The reduction of any solid body to a liquid state by means of some solvent.—3. A feeble combination, in which, with a mere mechanical change of properties, and without regard to definite proportions, one or more solids are equally diffused through some liquid. This mode of combination is so weak, that the liquid may be evaporated from the solid or solids, leaving them unchanged, except in texture or aggregation. There is usually, and probably always, a limit to the quantity of the solid or solids which can be dissolved by a given liquid, and this is called *saturation*. The liquid in which the solution is effected is called the *solvent* or *menstruum*.

Note.—This word is not used in chemistry or mineralogy for the melting of bodies by the heat of fire. The term *solution* is applied to a very extensive class of phenomena. When a solid disappears in a liquid, if the compound exhibits perfect transparency, we have an example of *solution*. The word is applied both to the *act* of combination and to the *result* of the process. Thus common salt disappears in water, that is, its solution takes place, and the liquid obtained is called a *solution of salt in water*. Solution is the result of attraction or affinity between the fluid and the solid. This affinity continues to operate to a certain point, where it is overbalanced by the cohesion of the solid; it then ceases, the fluid is said to be *saturated*, the point where the operation ceases is called *saturation*, and the fluid is called a *saturated solution*.—*Solution* is a true chemical union. *Mixture* is a mere mechanical union of bodies.—4. Resolution; explanation; the act of explaining or removing difficulty or doubt; as, the *solution* of a difficult question in morality; the *solution* of a doubt in casuistry.—5. Release; deliverance; discharge.—6. The *solvent* of resinous bodies is alcohol, and of some other similarly constituted substances. Naphtha, oil of turpentine, and ether, are *solvents* of caoutchouc; chlorine, and aqua regia, or nitro-muriatic acid, are *solvents* of gold. In most cases, heat increases the solvent powers of bodies.

SOMNAM'BULISM, *n.* [supra.] The act or practice of walking in sleep. The term, however, is generally used in a more extended sense, to comprehend all the phenomena that take place when a person, apparently insensible to external objects, acts as if he were in a state of consciousness. The phenomena of sleep-walking are very singular, the person affected performing many voluntary actions implying to all appearance a certain degree of perception of the presence of external objects. The somnambulist gets out of bed, often dresses himself, goes out of doors, and walks frequently over very dangerous places in safety. On awaking in the morning, he is either utterly unconscious of having stirred during the night, or remembers it as a mere dream. Sometimes the transactions of the somnambulist are carried much farther; he will mount his horse and ride, or go to his usual occupation. In some cases, somnambulists are capable of holding conversation. The term Somnambulism is also used to denote a certain state of a person under the influence of animal magnetism, in which the patient is said to recover his internal consciousness, while his outward senses are still asleep, and is enabled to see and hear with the pit of his stomach, the ends of his fingers, &c. &c. A little poem to be sung, or uttered with musical modulations; a ballad. The term is applied to either a short poetical or musical composition, but most frequently to both in union. As a poetical composition it may be largely defined a short poem divided into portions of returning measure, and turning upon some single thought or feeling. As a union of poetry and music, it may be defined a very brief lyrical poem, founded commonly upon agreeable subjects, to which is added a melody for the purpose of singing it. As denoting a musical composition, *song* is used to signify a vocal melody of any length or character, and not confined to a single movement; but as regards performance, it is confined to an air for a single voice. A short poem of fourteen lines, two stanzas of four verses each and two of three each, the rhymes being adjusted by a particular rule. The sonnet is a form of poetry much used by the Italian and Spanish poets; but not much in Britain, Germany, or France. The proper sonnet consists of two quatrains, with four lines and two rhymes each, and two terzines, each with three lines and a single rhyme. The last six lines, however, are susceptible of various arrangements; the one usually adopted in English is the rhyming of the fifth and sixth lines together, frequently after a full pause, so that the sonnet ends with a point, as in an epigram. The sonnet generally consists of one principal idea, pursued through the various antitheses of the different strophes. The lightness and richness of the Italian and Spanish languages enable their poets to express every feeling or fancy in the sonnet; but with us it has been found most suitable to grave, dignified, and contemplative subjects. Our best writers of sonnets are Milton and Wordsworth.—2. A short poem.

The soot of coal and that of wood differ very materially in their composition; the former does not indeed appear to have been accurately analyzed, but it evidently contains more carbonaceous matter than the latter. Coal soot contains substances usually derived from animal matter; also sulphate and hydrochlorite of ammonia; and has been used for the preparation of the carbonate. It contains likewise an empyreumatic oil; but its chief basis is charcoal, in a state in which it is capable of being rendered soluble by the action of oxygen and moisture; and hence, combined with the action of the ammoniacal salts, it is used as a manure, and acts very powerfully as such. The soot of wood has been minutely analysed, and found to consist of fifteen different substances, of which ulmin, azotized matter, carbonate of lime, water, acetate and sulphate of lime, acetate of potash, carbonaceous matter insoluble in alkalies, are the principal. SOUND, *n.* [Fr. *sonde;* Sp. *sonda. See* the following verb.] An instrument which surgeons introduce into the bladder, in order to discover whether there is a stone in that viscus or not.

SOUND, *v. t.* [Sp. *sondar* or *sondear;* Fr. *sonder.* This word is probably connected with the L. *sonus,* Eng. *sound,* the primary sense of which is to stretch or reach.] 1. To try, as the depth of water and the quality of the ground, by sinking a plummet or lead, attached to a line on which are marked the number of fathoms. The lower end of the lead is covered with tallow, by means of which some portion of the earth, sand, gravel, shells, &c. of the bottom, adhere to it and are drawn up. By these means, and the depth of water and the nature of the bottom, which are carefully marked on good charts, seamen may know how far a ship is from land in the night or in thick weather, and in many cases when the land is too remote to be visible. SOUND, *n.* [Sax. *son;* W. *swn;* Ir. *soin;* Fr. *son;* L. *sonus,* from *sono,* to sound, sing, rattle, beat, &c. This may be a dialectical variation of L. *tonus, tono,* which seems to be allied to Gr. τεινω, to stretch or strain, L. *teneo.*] 1. Noise; report; the object of hearing; that which strikes the ear; or more philosophically, an impression, or the effect of an impression, made on the organs of hearing by the vibrations of the air or other medium with which these organs are in contact, which vibrations are caused by the vibrations or tremulous motions of the sounding body; as, the *sound* of a trumpet or drum; the *sound* of the human voice; a horrid *sound;* a charming *sound;* a sharp *sound;* a high *sound;* a loud *sound;* a low *sound;* an acute *sound;* a grave *sound.* No body can emit a sound unless it be put into a tremulous or vibratory motion; and hence, sound considered with respect to the sounding body, consists of a motion of vibration impressed on the parts of the body; this motion is communicated to the air which surrounds the body, and produces in it corresponding undulations, by which the ear being affected, the sensation of sound is produced. The propagation of sound is not instantaneous; that is to say, the sensation is not produced at the same instant as the motion in the sonorous body which causes it;

for if a gun or a piece of ordnance be discharged at a considerable distance, the flash will be first seen, and after some seconds have elapsed, the report will be heard. In like manner, lightning always precedes thunder, and if the thunder cloud be at a considerable distance, several seconds will elapse before the thunder is heard. It has been ascertained that the atmosphere, in its ordinary state, conducts sound at the rate of 1130 feet per second. The velocity is subject to some slight variation, owing to the change of temperature, the moisture suspended in the air, and other causes; but 1130 feet per second may be taken as an average rate. If, however, there be a wind, its velocity must be added to 1130 feet, when it blows from the sounding body; and subtracted when it blows in a contrary direction. From these data, we are enabled to determine distances with considerable accuracy. For example, when a ship at sea fires a gun, by multiplying 1130 feet, the mean velocity of sound per second, by the number of seconds that elapse between the flash and the report, we obtain the distance of the ship in feet. In the same way we may ascertain the distance of a thunder cloud. Sound is propagated or radiates from the sounding body, in all directions, and in straight lines, and diminishes in intensity as it recedes from the sounding body; so that at different distances from the body, it is inversely as the squares of those distances. When sound is arrested in its progress by a smooth, hard, or elastic surface, as a rock, the wall of a house, of a cavern, or of a vault, it is thrown back or reflected, and thus forms what is called an *echo*, the law of the reflection being that the angle of reflection is always equal to the angle of incidence. Sounds are as various as the means that concur in producing them. Noise and discordant sounds arise from a want of isochronism in the vibrations of the sounding body; and loudness of sound depends on the greater extent of the vibrations. When the vibrations of a sonorous body are isochronous, the sound is always musical, and the quicker the vibrations, the more acute is the tone. The determination of the laws according to which sound is produced and transmitted to our organs, forms the object of that branch of physical science termed *acoustics.* — 2. A vibration of air caused by a collision of bodies or other means, sufficient to affect the auditory nerves when perfect. Some persons are so entirely deaf that they cannot hear the loudest *sounds.* *Audible sounds* are such as are perceptible by the organs of hearing. *Sounds* not audible to men, may be audible to animals of more sensible organs.—3. Noise without signification; empty noise; noise and nothing else.

It is the sense and not the *sound*, that must be the principle. *Locke.*

Sound dues, the sea-toll levied on all vessels passing the *sound* between Denmark and Sweden, collected at Elsineur.

SOUND, *v. i.* To make a noise; to utter a voice; to make an impulse of the air that shall strike the organs of hearing with a particular effect. We say, an instrument *sounds* well or ill; it *sounds* shrill; the voice *sounds* harsh.

And first taught speaking trumpets how to *sound.* *Dryden.*

2. To exhibit by sound or likeness of sound. This relation *sounds* rather like a fiction than a truth.—3. To be conveyed in sound; to be spread or published.

SOUND'ABLE, *a.* Not unfathomable; as, a *soundable* sea.

SOUND'-BŌARD, SOUND'ING-BŌARD, } *n.* The principal part of an organ, and that which makes the whole machine play. It is a reservoir into which the wind, drawn in by the bellows, is conducted by a port vent, and thence distributed into the pipes, placed over the holes of its upper part. It is also a thin board that propagates the sound in a violin, piano, harp, &c.

To many a row of pipes the *sound-board* breathes. *Milton.*

SOUND-BŌARDING, *n.* In *arch.*, the sound boarding of floors consists of short boards, which are disposed transversely between the joists, and supported by fillets fixed to the sides of the joists, for holding the substance called pugging, intended to prevent sound from being transmitted from one story to another. SOUND'ING-BŌARD, or SOUND'-BŌARD, *n.* A board or structure placed over a pulpit or other place occupied by a public speaker, to reflect the sound of his voice, and thereby render it more audible. Sounding boards are generally flat, and placed horizontally over the head of the speaker; but concave parabolic sounding boards have been tried, and found to answer better.—2. SOUND'INGS, *n.* The depths of water in rivers, harbours, along shores, and even in the open seas, which are ascertained by the operation of *sounding.* The term is also used to signify any place or part of the ocean, where a deep sounding line will reach the bottom; also, the kind of ground or bottom where the lead reaches. There are two plummets used in sounding, one called the *hand lead*, the other the *deep-sea lead;* both are shaped like the frustum of a cone. [*See* LEAD.] Sounding with the hand-lead, called by seamen *heaving the lead*, is generally performed by a single person, who stands in the main chains to windward, and throws the lead forward while the ship is in motion; so that by the lead sinking while the ship advances, the line may be almost perpendicular when it reaches the bottom. In using the *deep sea lead* at sea, or in deep water, it is usual previously to bring-to the ship, in order to retard her course; the lead is then thrown as far as possible from the ship, on the line of her drift, so that, as it sinks, the ship drives more perpendicularly over it. The bottom of the lead being well rubbed over with tallow, retains the distinguishing marks of the bottom; as, shells, ooze, gravel, &c. The depth of the water, and the nature of the ground, are carefully marked in the log book. *In soundings*, implies the being so near the land that a deep sea lead will attain the bottom, which is seldom practicable in the ocean.

SOUND'LESS, *a.* That cannot be fathomed; having no sound.

The husk of the oat, (called in Scotland *seeds*,) after being separated from the oatmeal by the sieve, still retains a considerable portion of farinaceous matter. It is steeped in water till the farinaceous matter is dissolved, and till the liquid has become sour. The whole is then made to pass through a sieve, which allows the milky liquid to pass through, but retains the husks. The liquid thus obtained is loaded with starchy matter which subsides to the bottom. The sour liquor is decanted off, and about an equal quantity of fresh water added. This mixture, when boiled, forms sowens, a very wholesome and nutritious article of food, which is much used in Scotland. It is eaten with milk or beer. In England it is called *flummery*.

A *sowm* of land is as much as will pasture one cow or ten sheep, or in some places one cow and five sheep; and, strictly speaking, to *sowm* the common is to ascertain the several *sowms* it may hold; and to *rowm* it is to portion it out amongst the dominant proprietors.

SPACE, *n.* [Fr. *espace*; L. *spatium*, space; *spatior*, to wander. This word is probably formed on the root of *pateo*.] 1. Room; extension in all directions. Space, in the abstract, is mere extension. Space is a simple idea, of which the modes are distance, capacity, extension, duration, &c. Space, considered with regard to length only,

is the same idea as that which we have of distance. If it be considered in regard to length, breadth, and thickness, it is the same as capacity. When considered between the extremities or boundaries of matter, which fills the capacity of space with something solid, tangible, and movable, it is called extension. Space may be conceived as existing without matter, for although the whole matter of the universe were annihilated, space would still remain. Space is usually divided into *absolute* and *relative*. *Absolute space* is that which is considered in its own nature, without regard to any thing external, which always remains the same; and is unbounded and immovable. *Relative space* is any portion of absolute space. It is capable of measurement, and is considered in regard to material objects. The ideas of space and of time enter into all our speculations on physical phenomena, and they are both necessarily involved in the idea of motion.

Pure *space* is capable neither of resistance nor motion. *Locke.*

In the oviparous fishes, with distinct sexes, the eggs are impregnated externally and arrive at maturity without the aid of the mother. The spawn being deposited by the female, the male then pours upon it the impregnating fluid. In the ovoviviparous fishes, sexual intercourse takes place, and the eggs are hatched in the uterus. In the oviparous fishes, which are hermaphrodite, the spawn is impregnated previous to deposition by the same individual which deposits the eggs. Fishes exhibit a great variety in regard to the number of their eggs. In some the number is small, while in others it is prodigiously great. In the

spawn of a cod-fish, for example, no fewer than 3,686,760 eggs have been found. In general, before spawning, fish forsake the deep water and approach the shore, and some fish leave the salt water and ascend the rivers before spawning, and then return again. —2. Special administration, in *law*, is one in which the power of an administrator is limited to the administration of certain specific effects, and not the effects in general of the deceased — *Special bail*, consists of actual sureties recognised to answer for the appearance of a person in court; as distinguished from *common bail*, which is nominal.—*Special bailiff*, is a bailiff appointed by the sheriff, for making arrests and serving processes.—*Special case.* In *Scots law*, in civil jury causes, a special case differs from a special verdict only in this, that the special verdict is returned by the jury; whereas the special case is adjusted by the parties themselves, or by their counsel, and sets forth the special facts on which they are agreed, without the evidence.—*Special charge.* In *Scots law*, letters of special charge, are letters passing under the signet, charging the heir of one who has died infeft in lands, to enter heir to him, under certification that if no entry takes place, the complainer shall have the same execution against the lands as if the heir had entered.—*Special constable*, a person sworn to aid the constituted authorities, military or civil, in maintaining the public peace, on occasions of exigency; as, to quell a riot. Sometimes the epithet stands for the positive term; as, many *specials* were in attendance.—*Special contract.* [*See* SPECIALTY.]—*Special demurrer*, is one in which the cause of demurrer is particularly stated.—*Special grace*, in *theol.*, according to Edwards, is "the renewing and sanctifying influences of the Holy Spirit, as distinguished from *common grace*, which only awakens and convicts."—*Special imparlance*, is one in which there is a saving of all exceptions to the writ or count, or of all exceptions whatsoever.—*Special jury*, is a jury of a superior class or supposed experience regarding the matter at issue. Another method of finding a special verdict, is when the jury find a verdict generally for the plaintiff, but subject to the opinion of the court on a special case stated by the counsel on both sides, with regard to a matter of law.—*Special verdict*, in *Scots law*, in a criminal trial, a return of certain facts or circumstances as proved, without any general conclusion from them as to the pannel's guilt, the conclusion being left to be made by the judge, according to his opinion of the lawful construction of the facts so laid before him. In civil causes tried by jury, a *special verdict* must be confined to specific findings of fact, with no detail of the evidence on which the verdict rests.—*Special warrant*, a warrant to take a person and bring him before a particular justice who granted the warrant.

SPECIE, *n.* (spe′shy.) Gold and silver coin, in contradistinction to paper money. [*See* SPECIES.]

SPECIES, *n.* (spe′shiz.) *sing.* and *plur.* [L. from *specio*, to see. *See* SPECIAL.] 1. In *zool.* and *bot.*, a species is usually defined a collection of individuals that are precisely alike in every character not capable of change by any accidental circumstances, and capable of uniform, invariable, and permanent continuance by natural propagation. All changes produced by accidental causes, in individuals of a species, and which are not capable of uniform, invariable, and permanent continuance by natural propagation, indicate and mark what are called *varieties*.

There are as many *species* as there are different invariable forms or structures of vegetables. *Martyn.*

2. In *mineral.*, a collection of minerals which are composed of the same ingredients, and combined in the same proportions.—3. In *logic*, a special idea, corresponding to the specific distinctions of things in nature, or it is a predicable which is considered as expressing the whole essence of the individuals of which it is affirmed. The genus and difference together make up, in logical language, the *species*. For example, a "biped" is compounded of the genus "animal," and the difference, "having two legs." The difference which, together with the genus, makes up the species, is termed the *specific difference*. [*See* PREDICABLE.]—4. Sort; kind; *in a loose sense*; as, a *species* of low cunning in the world; a *species* of generosity; a *species* of cloth.—5. Appearance to the senses; visible or sensible representation.

8. Coin, or coined silver and gold, used as a circulating medium; as, the current *species* of Europe. In modern practice, this word is contracted into *specie*. What quantity of *specie* has the bank in its vault? What is the amount of all the current *specie* in the country? What is the value, in *specie*, of a bill of exchange? We receive payment for goods in *specie*, not in bank notes.—9. In *phar.*, a simple; a component part of a compound medicine.—10. The old pharmaceutical term for powders.—11. In *alge.*, the letters, symbols, marks, or characters, which represent the quantities in any operation or equation.—In *geom.*, *figures of the same species*, are those which have the same form, whatever be their size.—In *spherical trigonometry*, the sides and angles of spherical triangles, are said to be of the *same species*, when by comparing any two sides, any two angles, or an angle and a side together, each is found to be greater or less than, or equal to, a quadrant or a right angle. But when by comparing a side with a side, an angle with an angle, or a side with an angle, one is found to be less, and an-

other greater than a quadrant or a right angle, such sides and angles are said to be of *different species.* The word *affection* is often used in spherical trigonometry in the same sense as species.—12. In *optics*, the image painted on the retina by the rays of light reflected from the several points of the surface of an object, received by the pupil, and collected in their passage through the crystalline lens, &c.

SPECIF'IC, SPECIF'ICAL, *a.* [Fr. *specifique;* It. *specifico.*] 1. That makes a thing of the species of which it is; designating the peculiar property or properties of a thing, which constitute its species, and distinguish it from other things. Thus we say, the *specific* form of an animal or a plant; the *specific* form of a cube or square; the *specific* qualities of a plant or a drug; the *specific* difference between an acid and an alkali; the *specific* distinction between virtue and vice.

> *Specific* difference is that primary attribute which distinguishes each species from one another. *Watts.*

2. In *med.*, acting upon some particular organ more than upon others; possessed of peculiar efficacy in the cure of a particular disease. [*See the noun.*] —*Specific character*, in *bot.*, a circumstance or circumstances distinguishing one species from every other species of the same genus.—*Specific gravity*, in *nat. philosophy*, the weight of any body under a given bulk or volume, or it is the weight of any particular kind of matter as compared with the weight of the same bulk of some other body, of which the weight is supposed to be familiarly known, and is therefore taken as the standard of comparison. Pure distilled water, at the temperature of 60° of Fahrenheit, is the substance usually employed for the purpose of comparing together the weights of all substances, except the gases. A cubic foot of distilled water at the temperature of 60° is found to weigh exactly 1000 ounces avoirdupois; consequently, assuming this as the specific gravity of distilled water, and comparing all other bodies with this, the same numbers that express their specific gravities, will at the same time express the weight of a cubic foot of each in avoirdupois ounces, which affords great facility to numerical computations. Or if the specific gravity of water be expressed by 1, the specific gravity of other substances will be expressed by a thousandth part of the former numbers. This only requires that three decimal places should be taken. Thus, a cubic foot of gold weighs 19,250 ounces; hence, taking 1000 for the specific gravity of water, 19,250 will express the specific gravity of gold; or, if 1 be the specific gravity of water, the thousandth part of 19,250, which is 19·250, will be the specific gravity of gold. In bodies of equal magnitudes, the weights are directly as the specific gravities; in bodies of the same specific gravities, the weights are directly as the magnitudes; in bodies of equal weights the specific gravities are inversely as the magnitudes; and the weights of different bodies are to each other in the compound ratio of their magnitudes and specific gravities. A body when immersed in a fluid loses a portion of its weight which is exactly equal to the weight of an equal bulk of the fluid; hence, if a body be weighed in air (or rather in vacuo), and then in water, the difference between the two weights will give the weight of a quantity of water equal to the bulk of the solid. From this we can easily determine the specific gravity of any solid body; for, since in equal magnitudes the weights are as the specific gravities, the weight of the water equal in volume to the body, is to the actual weight of the body, as the specific gravity of water = 1, to the specific gravity of the body. [*See* GRAVITY and HYDROMETER.]—*Specific heat.* [*See* HEAT.]—*Specific name*, in *bot.*, is now used for the name which, appended to the name of the genus, constitutes the distinctive name of the species; but it was originally applied by Linnæus to the essential character of the species, or the *essential difference.* The present specific name he at first called the *trivial name.*

SPECIF'IC, *n.* In *philosophy*, that which is peculiar to any thing, and distinguishes it from all others.—2. A medicine which acts upon some particular organ more than upon others: thus, ipecacuanha appears to have a *specific* action on the respiratory mucous membrane.—3. A medicine which is more uniform in its effects than any other, in any particular disorder: thus, cinchona is called a *specific* in certain forms of intermittent fever, and mercury in syphilis, &c. No such thing as an infallible specific is known.

SPECIF'ICALLY, *adv.* In such a manner as to constitute a species; according to the nature of the species. A body is *specifically* lighter than another, when it has less weight in the same bulk than the other.

Thus we call things exhibited for amusement, public *spectacles*, as

SPEC'TACLES, *n. plur.* [L. *spectaculum.* *See* SPECTACLE.] A well known and invaluable optical instrument used to assist or correct some defect in the organs of vision. Common spectacles consist of two lenses, either convex or concave, set in a frame so constructed as to adhere to the nose and temples, and keep the lenses in the proper position. The earlier kinds were merely fixed on the nose. Spectacles with convex lenses are used to aid the sight of the aged, or those who are termed long or far sighted; and spectacles with concave lenses are used to assist the vision of those who are near sighted. In long sighted persons the refractive powers of the eye are too feeble, or the cornea is too much flattened; hence, the rays of light coming from an object after entering the eye, do not converge sufficiently soon to be brought to a focus, and form a perfect image of the object on the retina. The convex lens counteracts this defect by increasing the convergence of the rays, and causing them to meet at the retina. Short-sightedness is a defect the very reverse of that which has been stated, and hence, must be corrected by opposite means, namely, by concave lenses. In both cases the value of spectacles depends upon their being accurately adapted to the state of the eye. There is a kind of spectacles, commonly called *preserves* or *sight preservers*, the glasses of which are usually plane, and sometimes coloured; their utility is, however, dubious. Another kind of spectacles, called *goggles*, limit the field of view, and are used for correcting obliquity of vision. Another kind, called *periscopic* spectacles, has been contrived in order to allow considerable latitude of motion to the eyes without fatigue. The lenses employed in this case are either of a meniscus or concavo-convex form, the concave side being turned to the eye. An invention of recent origin, called *railway spectacles*, with wire-cloth sights, is useful for keeping sand, ashes, &c., out of the eyes. We know not when or by whom spectacles were invented. Some assign their origin to the 12th, others to the 13th century. Spectacles, as they form an instrument of binocular power, are usually designated a *pair of spectacles.*

SPEC'TRA, *n. plur.* [L. *spectrum*, from *specto*, to behold. *See* SPECTRUM.] Images presented to the eyes after removing them from a bright or coloured object, or closing them. If, for example, we look intensely with one eye upon any coloured object, such as a wafer placed on a sheet of white paper, and immediately afterwards, turn the same eye to another part of the paper, we shall see a similar spot, but of a different colour. Thus, if the wafer be red, the seeming spot will be green; if black, it will be changed into white. These images are also termed *ocular spectra* and *accidental colours.*

In *optics*, the name given to an elongated image of the sun, formed on a wall or screen, by a beam of solar light passing through a small hole in a window-shutter into a dark room, and refracted by a triangular glass prism. The ray, on passing through the prism, is decomposed, and separated into seven rays of different colours, such as are observable in the rainbow. These are exhibited in the elongated image or *spectrum*, in the following order; namely, *red, orange, yellow, green, blue, indigo*, and *violet;* the red being lowermost. As the spectrum is produced by solar light, it is frequently called the *solar spectrum*, and because it is formed by means of a prism, it is further termed the *prismatic spectrum*, and the colours composing it the *prismatic colours.* A spectrum may be formed by any other luminous body as well as the sun.

5. Power of sight.

Thou hast no *speculation* in those eyes.† *Shak.*

6. In *com.*, the act or practice of buying articles of merchandize, or any purchasable commodities whatever, in expectation of a rise of price and of selling them at an advance, as distinguished from a regular trade, in which the profit expected is the difference between the retail and wholesale prices, or the difference of price in the place where the goods are purchased, and the place to which they are to be carried for market. Speculation on a large scale, on the principle of monopolizing, or that kind of speculation which consists in the purchase and sale of shares in public companies, as well as "dabbling in the stocks," and a variety of other hazardous transactions, may be considered as different species of gambling, and are often no less ruinous. To have success; to prosper; to succeed; that is, to advance in one's enterprise.

Note.—In the phrase, "God speed," there is probably a gross mistake in considering it as equivalent to "may God give you success." The true phrase is probably "*good speed;*" *good* in Saxon, being written *god.* I bid you or wish you *good speed*, that is, good success.

SPEED, *n.* Swiftness; quickness; celerity; *applied to animals.* We say, a man or a horse runs or travels with *speed;* a fowl flies with *speed.* We speak of the *speed* of a fish in the water, but we do not speak of the *speed* of a river, or of wind, or of a falling body. Spermaceti Whale (Physeter macrocephalus).

generally met with in the South Seas, but occasionally also on the coasts of Greenland. This animal, called the cachalot or white whale, is of immense size, frequently sixty or more feet in length, of which the head constitutes one third. The head is the chief reservoir of the spermaceti, which, however, is found in several other parts of the body mixed with the sperm oil. During the life of the animal, the spermaceti is in a fluid state, and on the head being opened, has the appearance of an oily white liquid. On exposure to the air, the spermaceti concretes, and deposits from the oil. They are then separated, and put into different barrels. Some of the larger whales have been known to yield 24 barrels of spermaceti, and from 70 to 100 barrels of oil. After being brought to England, the spermaceti is purified. It then concretes into a white, crystallized, brittle, semitransparent unctuous substance, nearly inodorous and insipid. It dissolves in boiling alcohol, and as the solution cools, it is deposited in perfectly pure lamellated crystals. It is then called cetine. A hundred parts of spermaceti consist of 60 parts of margaric and oleic acids, 40 parts of ethal, and 0·9 parts of a yellow extractiform substance. It is bland and demulcent, with considerable nutritive qualities when taken internally. It is chiefly employed externally as an ingredient in ointments and cerates. It is also largely used to form candles.

In *geom.,* a spheroid is a solid, generated by the revolution of an ellipse about one of its axis. SPI'DER, *n.* [D. *spinne;* Ger. *spinne;* Sw. *spindel;* Dan. and Ger. *spinner;* Sw. *spinna;* Sax. *spinnan*, to spin.] 1. The common name of the animals of the family Araneides, of the class Arachnidæ, some of which are remarkable for spinning webs for taking their prey and forming a convenient habitation, and for the deposit of their food. The abdomen of the spider is furnished with from four to six cylindrical or conical, articulated mammillæ, with fleshy extremities, which are perforated with numberless small orifices for the passage of silky filaments of extreme tenuity, with which they form their webs, and which proceed from internal reservoirs. Their mandibles are terminated by a movable hook, flexed inferiorly, underneath which, and near its extremity, which is always pointed, is a little opening, that allows a passage to a venomous fluid contained in a gland of the preceding joint. After wounding their prey with their hooked mandibles, they inject this poison into the wound, which suddenly destroys the victim. A very great diversity exists in the modes in which spiders construct their webs, and in the situations in which they are placed. Some spiders are sedentary, and catch their prey by entangling them in their webs; others roam abroad in search of their prey.

When the fibres of cotton, wool, flax, &c., are intended to be woven, they are reduced to threads of uniform size, more or less fine, by the well-known process of spinning. The primitive modes of spinning by the spindle and distaff, and by the spinning wheel, only enable the spinner to produce a single thread, or at the utmost, two threads, at once; but with the almost automatic spinning machinery, which in modern times has been called into existence by the cotton manufacture, one individual may produce nearly two thousand threads at the same time.—2. The act or practice of forming webs, as spiders.

SPI'RAL, *a.* [It. *spirale;* Fr. *spiral;* from L. *spira*, a spire.] Winding round a fixed point or centre, and continually receding from it, like a watch-spring. [*See the noun.*]—2. In *common lan.*, winding round a cylinder or other round body and at the same time rising or advancing forward, like a cork-screw. The column in the Place Vendome, at Paris, is divided by a *spiral* line into compartments. A whirlwind is so named from the *spiral* motion of the air.—3. In *arch.* and *sculp.*, applied to a curve that ascends winding about a cone or spire, so that every point of it continually approaches the axis. It is thus distinguished from the helix or screw, which winds in the same manner round a cylinder.

SPI'RAL, *n.* In *geom.*, the name given to a class of curves, distinguished by this property, that they continually recede from a centre or pole, while they continue to revolve about it. The main-spring of a watch gives an idea of this kind of curve. Spirals receive different names from the properties by which they are characterized, or from their inventors; as, the *spiral of Archimedes;* the *logarithmic spiral;* the *loxodromic spiral;* the *parabolic spiral*, &c.—2. In *common lan.*, a helix or curve which winds round a cylinder like a screw.

They are generally present among the other vessels of plants, and in trees are found chiefly in the medullary sheath surrounding the pith. The fibre coils either from right to left, or the reverse, somewhat in the manner of a cork-screw. The fibre may be single or double, or it may be composed of numerous threads up to 25. These vessels are extremely delicate, their diameter averaging the 1000th of an inch. Their function is that of the conveyance of air. They are very seldom found in the root or bark of wood, but are frequently abundant in the other parts, especially in the leaves and flowers. They are easily discovered on breaking asunder the leaves and stalks of many plants, when the fibres may be unrolled, and present themselves as delicate filaments, like those of spiders.

SPI'RAL-WHEELS, *n.* In *mill work*, a species of gearing much used in the textile manufactures. Spiral wheels serve the same purpose as bevel wheels, and are better adapted for light machinery. The teeth are formed upon the circumference of cylinders of the required diameter, at an angle of 45° with their respective axes, when the direction of the motion is to be changed from the horizontal to the vertical. By this construction the teeth become in fact small portions of screws or spirals winding round the cylinders, whence the name.

Spiral Wheels.

SPIRA'TION,† *n.* [L. *spiratio.*] A breathing.

SPIRE, *n.* [L. *spira;* Gr. σπειρα: Sp. *espira;* from the root of L. *spiro*, to breathe. 2. A body that shoots up to a point; a tapering body; a conical or pyramidical body; the tapering portion of a steeple rising above the tower; a steeple.

> With glist'ring *spires* and pinnacles adorn'd. *Milton.*

In *arch.*, the pyramidal or conical termination of a tower or turret. The earliest spires were merely pyramidal or conical roofs, specimens of which still exist in Norman buildings, as that of the tower of Than church in Normandy. These roofs, becoming gradually elongated, and more and more acute, resulted at length in the elegant tapering spire; among the many existing examples of which, probably, that of Salisbury is the finest. The spires of medieval architecture, to which alone they are appropriate, are generally square, octagonal, or circular in plan; they are sometimes solid, more frequently hollow, and are variously ornamented with bands encircling them, with panels more or less enriched, and with spire lights, which are of infinite variety. Their angles are sometimes crocketted, and they are almost invariably terminated by a finial. In the later styles the general pyramidal outline is obtained by diminishing the diameter of the building in successive stages, and this has been imitated in modern spires, in which the forms and details of classic architecture have been applied to structures essentially medieval. The term spire is sometimes restricted to signify such tapering buildings, crowning towers or turrets, as have parapets at their base. When the spire rises from the exterior of the wall of the tower without the intervention of a parapet, it is called a *broach*.—3. A stalk or blade of grass or other plant. How humble ought man to be, who cannot make a single *spire* of grass!—4. The top or uppermost point of a thing.

6. A fountain of water; an issue of water from the earth, or the basin of water at the place of its issue. The rain which falls from the atmosphere is absorbed in three different ways. One part of it collects in rills on the surface of the ground; these unite in streams or rivulets, which, flowing into one another, form rivers, and thus it is conveyed to the ocean. A second part is taken up in giving humidity to the soil, from which it is returned to the atmosphere by evaporation. A third portion descends into the earth through soils of a spongy or porous nature, or through crevices and interstices in the strata, but being obstructed by other strata, forms subterraneous reservoirs, at various depths. When confined in this manner, it is subject to the pressure of the water which fills the channels through which it has descended, and when this pressure is sufficient to overcome the resistance of the superincumbent mass of earth, the water breaks through the superficial strata, and gushes forth in a spring. In descending downwards, and rising upwards through various mineral masses, the water of springs becomes impregnated with gaseous, saline, earthy, or metallic admixtures, as carbonic acid gas, sulphuretted hydrogen gas, nitrogen, muriate of soda, sulphate of lime, carbonate of lime, silica, carbonate of iron, &c. Warm and hot springs are common, especially in volcanic countries, where they are sometimes distinguished by violent ebullitions. Springs are most common on the sides and at the bottoms of mountains, as the copious rains which fall on the mountains, descending through the crevices and fissures, easily find a passage out at the bottom. As a general rule, springs are permanent in proportion to the depth to which the water which supplies them has descended from the surface. The temperature of deep seated springs is generally the same with the mean temperature of the atmosphere. Some springs run for a time and then stop altogether, and after a time, run again, and again stop; these are called *intermitting springs*. [*See under* INTERMITTING.] Others do not cease to flow, but only discharge a much smaller quantity of water for a certain time, and then give out a greater quantity; these are called *variable or reciprocating springs*. Lakes and ponds are usually fed by *springs*.—7. The place where water usually issues from the earth, though no water is there. Thus we say, a *spring* is dry.—8. For the northern hemisphere, the spring season commences when the sun enters Aries, or about the 21st of March, and ends at the time of the summer solstice, or about the 22d of June. In *common law*, spring commences in February and ends in April.—12. In *seamen's lan.*, a crack in a mast or yard, running obliquely or transversely. The number of stamens varies in different plants, from one to a hundred or more. In *her.*, a *standard* is an ensign, carried at the funerals of great personages. It is usually fifteen feet long, and split at the points; at the top is the arms of the union, then the crests and motto of the defunct.—2. In *com.*, the original weight, measure, or coin sanctioned by government, and committed to the keeping of a magistrate, or deposited in some public place, to regulate, adjust, and try weights and measures, used by particular persons in traffic. Thus the imperial gallon is the *standard* measure of capacity in this country; the imperial yard is the *standard* of lineal measure; and the pound troy is the *standard* of weight. [*See* MEASURE, WEIGHT.] The *standards* of weights and measures, in England, were appointed by Magna Charta to be kept in the exchequer, by a special officer, called the clerk or controller of the market.—3. That which is established as a rule or model, by the authority of public opinion, or by respectable opinions, or by custom or general consent; as, writings which are admitted to be the *standard* of style and taste. Homer's Iliad is the *standard* of heroic poetry. Demosthenes and Cicero are the *standards* of oratory. Of modern eloquence, we have an excellent *standard* in the speeches of Lord Chatham. Addison's writings furnish a good *standard* of pure, chaste, and elegant English style. It is not an easy thing to erect a *standard* of taste.—4. In *coinage*, the proportion of weight of fine metal and alloy established by authority. The standard fineness of gold coins is at present 22 carats, that is, 22 parts of fine gold, and 2 of alloy. The pound troy of standard gold is coined into $46\frac{29}{40}$ sovereigns, or into £46 14s. 6d. The mint or standard price of gold is therefore said to be £46 14s. 6d. per pound troy, or £3 17s. 10½d. an ounce. The standard fineness of silver coins is 11 ounces 2 dwts. of pure silver, and 18 dwts. of alloy, making together 1 pound troy, which is coined into 66 shillings.—5. A tree or shrub which stands singly, without being attached to any wall or support. In gardening and planting, they are distinguished into three kinds; the *full standard*, whose stem is suffered to grow up seven or eight feet, or more, before it is allowed to branch out; the *half standard*, which is allowed to run up three or four feet, and then permitted to branch out; and the *dwarf standard*, whose stem is only allowed to reach a height of one or two feet before it is permitted to branch.—6. In *ship-building*, an inverted knee placed upon the deck instead of beneath it, with its vertical branch turned upward from that which lies horizontally.—7. In *bot.*, the upper petal or banner of a papilionaceous corol.—8. In *joinery*, any upright in a framing, as the quarters of partitions, the frame of a door, and the like.—*Standard* is also an old term for a candlestick of large size, standing on the ground, with branches for several lights.—9. Money is the *standing* measure of the value of all other commodities. Legislative bodies have certain *standing* rules of proceeding. Courts of law are or ought to be governed by *standing* rules. There are *standing* rules of pleading. The gospel furnishes us with *standing* rules of morality. The Jews, by their dispersion and their present condition, are a *standing* evidence of the truth of revelation and of the prediction of Moses. Many fashionable vices and follies ought to be the *standing* objects of ridicule. — *Standing orders*, the orders made by either house of parliament respecting the manner in which business shall be conducted in it. -4. The stannary courts of Devon and Cornwall are courts of record for the administration of justice among the tinners. They are held before the lord warden and his substitutes.

STAN'NARY, *n.* A tin mine. Stannaries are the mines and works from which tin is dug and purified; but the term is used as including by one general designation the tin mines within a particular district, the tinners employed in working them, and the customs and privileges attached to the mines, and to those employed in digging and purifying tin. The great stannaries of England are those of Devon and Cornwall.

A stanza may contain verses of a different length or number of syllables, and a different number of verses; or it may consist of verses of equal length. Stanzas are said to have been first introduced from the Italian into French poetry about the year 1580, and thence they were introduced into England. The principal Italian stanza is the *ottava rima,* which consists of six lines in alternate rhyme, ended by a couplet, the lines being decasyllabic, or rather hendecasyllabic. The Spenserian stanza consists of eight decasyllabic and an Alexandrian at the end; the first and third verses forming the first rhyme; the second, fourth, fifth, and seventh, and the eighth and ninth a third rhyme. There is a great variety of stanzas in the poetry of modern languages, according to the rhythm and structure of the poem.

Stapelia variegata.

grotesque appearance. In most instances the flowers give off very unpleasant odours, insomuch that the name of carrion-flower has been given to some of these plants. They are, nevertheless, cultivated on account of their singular and beautiful flowers.

STA'PES, *n.* [L. a stirrup.] One of the bones of the internal ear, so called from its shape.

STAPH'ISINE, *n.* A substance found along with delphine in *Delphinium Staphysagria.* It is said to be composed of 23 equivalents of hydrogen, 32 of carbon, 4 of oxygen, and 1 of nitrogen. It is acrid and poisonous, but is probably only a compound of delphine.

STAPHYLE'A, *n.* Bladder-nut, a genus of plants, the type of the nat. order Staphyleaceæ. Six species have been enumerated, one a native of Europe, one of North America, one of Japan, two of Jamaica, one of Peru, and one of Himalaya. *S. pinnata,* or common bladder-nut, is a native of the middle and south of Europe, and occurs occasionally in hedges and thickets in Yorkshire. The wood is used for various kinds of turning. The seeds are edible, and act as a mild aperient.

STAPHYLEA'CEÆ, *n.* A small nat. order of plants belonging to the syncarpous group of polypetalous exogens. The species are shrubs, with opposite pinnate leaves, and both common and partial stipules. The flowers are arranged in terminal stalked racemes. There are only three genera belonging to the order, which inhabit the warmer and temperate parts of the earth. Only one species is found in Europe, the *Staphylea pinnata.* The seeds of all contain a mild oil, which may be expressed.

STA'PLE, *n.* [Sax. *stapel, stapul,* a stake; D. *stapel,* a pile, stocks, staple; *stapelen,* to pile; G. *stapel,* a stake, a pile or heap, a staple, stocks, a mart; Sw. *stapel;* Dan. *stabel,* a staple; *stabler,* to pile; *stabbe,* a block or log; *stab,* a *staff.* We see this word is from the root of *staff.* The primary sense of the root is to set, to fix. *Staple* is that which is fixed, or a fixed place, or it is a pile or store.] 1. A settled mart or market; an emporium. In England, formerly, the king's *staple* was established in certain ports or towns, and certain goods could not be exported, without being first brought to these ports to be rated and charged with the duty payable to the king or public. The principal commodities on which customs were levied, were *wool, skins,* and *leather,* and these were originally the *staple* commodities. Hence the words *staple* and *staple commodities,* came in time to signify the principal commodities grown or manufactured in a country or town, either for exportation or home consumption. Thus cotton is the *staple commodity* of several of the Southern States of America; the manufacture of cotton is the *staple trade* of Manchester; the manufacture of hardwares is the *staple* of Birmingham; the manufacture of shawls is the *staple* of Paisley; and the manufacture of muslin and other fabrics, and the production of iron, form the *staple* of Glasgow.—2. STA'PLER, *n.* A dealer; as, a wool *stapler.*

STAR, *n.* [Sax. *steorra;* G. *stern;* D. *star;* Gr. αστηρ: Sans. *tara;* W. *seren.*] 1. An apparently small luminous body in the heavens, that appears in the night, or when its light is not obscured by clouds or lost in the brighter effulgence of the sun. *Stars* are fixed or planetary. The fixed stars are known by their perpetual twinkling, and by their being always in the same position in relation to each other. The planets do not twinkle; they shine with a steady light; they revolve round the sun, and are continually changing their

positions with regard to the other heavenly bodies, their motions being sometimes direct, and sometimes retrograde. In *astron.*, the word *star* is chiefly applied to those luminous heavenly bodies which are situated beyond the solar system. The principal points which form the subjects of astronomical inquiries regarding the stars, are, their apparent and relative magnitudes, their distribution, their number, their distances, motions, and nature. In order to distinguish the stars one from another, the ancients divided the heavens into different spaces called constellations, which they supposed to be occupied by the figures of animals and other objects, as a lion, a bear, a man, a lyre, &c. Each of these figures was made to comprehend a group of stars, and to a few of the brightest stars they gave particular names. These ancient figures have been retained by the moderns, who, in order to distinguish the stars in the same constellation from each other, have either numbered or marked them with certain letters of the Greek and other alphabets. The stars are divided into different magnitudes, according to their apparent size, the largest being said to be of the first magnitude, the next largest of the second magnitude, and so on to the sixth or seventh magnitude, which last class comprehends the least stars that are visible to the naked eye. All the stars beyond the sixth or seventh magnitude are called *telescopic stars*, as they cannot be seen without the aid of the telescope. Those stars which lie in spaces between the constellations, and are therefore not included in them, are called *unformed stars*. The gradations of magnitude among the telescopic stars are continued by astronomers from the eighth down to the sixteenth. The stars are very irregularly distributed over the celestial sphere. In some regions scarcely a star is to be seen, while in others they seem crowded together, especially in the milky way, where they appear, when viewed through a powerful telescope, to be crowded almost beyond imagination. Of the stars visible to the naked eye at any one time, the number probably does not exceed a few thousands, but in the telescope their number is so great as to defy all calculation; and, besides, there is every reason to believe that there are countless hosts which lie beyond the reach of the most powerful telescopes. The distances of the fixed stars from the earth is so great, that if we except one or two instances, perhaps still doubtful, all the attempts of astronomers to determine these distances have hitherto been fruitless. The double star 61 Cygni, is reckoned the nearest of the fixed stars, and its distance is computed to be 592,000 times the mean radius of the earth's orbit. The stars are observed to have motions of their own, and it is concluded that their proper motions are performed in circular or elliptic orbits, round some very remote centre. Many stars have been observed whose light appears to undergo a regular periodic increase and diminution of brightness, amounting, in some instances, to a complete extinction and revival. These are called *variable* and *periodic stars*. It is found that some stars, formerly distinguished by their splendour, have entirely disappeared; others have shone forth with extraordinary brilliancy, and, after a longer or shorter period, have gradually died away and become extinct. These are called *temporary stars*. Many of the stars are found, when observed with telescopes of high magnifying powers, to be composed of two, and some of them of three or more stars in close juxtaposition. These are termed *double* and *multiple stars*. There are certain irregular spots of pale light, and ill-defined figure, which occur frequently in the heavens. These are termed *nebulæ*. Some of these are, by the aid of the telescope, resolvable into clusters of small stars; but there are others which are not wholly resolvable into separate stars; and there are others again in which there is no appearance whatever of stars. The stars are considered by astronomers to be suns, each of them forming the centre of a system, round which planets revolve. Their immense numbers exhibit the astonishing extent of creation and of divine power.—2. The pole-star. [*A particular application, not in use.*]—3. In *astrol.*, a configuration of the planets, supposed to influence fortune. Hence the expression, "You may thank your *stars* for such and such an event."

A pair of *star*-cross'd lovers. *Shak.*

4. The figure of a star; a radiated mark in writing or printing; an asterisk; thus *; used as a reference to a note in the margin, or to fill a blank in writing or printing where letters are omitted.—5. In *Scripture*, Christ is called the *bright and morning star*, the star that ushers in the light of an eternal day to his people; Rev. xxii.—Ministers are also called *stars in Christ's right hand*, as, being supported and directed by Christ, they convey light and knowledge to the followers of Christ; Rev. i.—The twelve stars which form the crown of the church, are the twelve apostles; Rev. xii.—6. The figure of a star; a decoration worn by knights.—7. A person or thing shining above others. Specially, a distinguished and brilliant theatrical performer.—8. STÄR-ANISE, *n.* The seeds of the *Illicium anisatum*, a plant inhabiting India, belonging to nat. order Magnoliaceæ. They are considered in India to be powerfully stomachic and carminative. A very fragrant volatile oil is obtained from them. The Chinese burn them in their temples, and Europeans employ them to aromatize certain liquors, such as the Anisette de Bordeaux.

STÄR-APPLE, *n.* The popular name of several species of Chrysophyllum, whose fruit is esculent. *Chrysophyllum Cainito* is the most important species. It is a native of the West Indies. The fruit resembles a large apple, which in the inside is divided into ten cells, each containing a black seed, surrounded by a gelatinous pulp. It is eaten in the warm climates of America by way of dessert.

STÄRBOARD, *n.* [Sax. *steor-bord*; G. *steuerbort*, as if from *steuer*, the rudder or helm; D. *stuur-bord*, as if from *stuur*, helm; Sw. and Dan. *styrbord*. But in Fr. *stribord*, Sp. *estribor*, Arm. *strybourz* or *stribourh*, are said to be contracted from *dexter-bord*, right-side. *Star-bord* is from *steer-bord*, the tiller being on the right hand of the steersman.] The right hand side of a ship or boat, when a spectator stands with his face toward the head, stem, or prow.

STÄRBOARD, *a.* Pertaining to the right hand side of a ship; being or lying on the right side; as, the *starboard* shrouds; *starboard* quarter; *starboard* tack. In *seamanship*, *starboard*, uttered by the master of a ship, is an order to the helmsman to put the helm to the starboard side. The term *larboard*, uttered in like manner, would imply an order to put the helm to the larboard side; but as the words *starboard* and *larboard* are apt to be mistaken, from their resemblance in sound,

it is usual to substitute the words *to port*, for larboard.

STÄRCH, *n.* [Sax. *stearc*, rigid, stiff; G. *stärke*, strength, starch, *stark*, strong. *See* STARE and STEER.] A proximate principle of plants, universally diffused in the vegetable kingdom, and of very great importance. It occurs in seeds, as in those of wheat and other cereal grains, and also in leguminous plants; in roots, as in the tubers of the potato; in the stem and pith of many plants, as in the sago plant; in some barks, as in that of cinnamon; and in pulpy fruits, such as the apple. Finally, it is contained in the expressed juice of most vegetables, such as the carrot, in a state of suspension, being deposited on standing. The starch of commerce is chiefly extracted from wheat flour. When pure, it is a snow-white powder, of a glistening appearance, which makes a crackling noise when pressed with the finger. It is composed of transparent rounded grains, the size of which varies in different plants; those of the potato being the largest, and those of wheat and rice the smallest. It is insoluble in cold water, alcohol, and ether; but when heated with water, it is converted into a kind of solution, which, on cooling, forms a stiff semi-opaque jelly. If dried up, this yields a translucent mass, which softens and swells into a jelly with water. The solution or mixture of starch and water strikes a deep blue colour with free iodine. Hence the solution of starch becomes an admirable test of the presence of iodine. Pure starch consists of 12 equivalents of carbon, 10 of hydrogen, and 10 of oxygen. It is employed for stiffening linen and other cloth. When roasted at a moderate heat in an oven, it is converted into a species of gum employed by calico printers; potato starch answers best for this purpose. Starch is convertible into sugar by dilute sulphuric acid. *Starch* forms the greatest portion of all farinaceous substances, particularly of wheat flour, and it is the chief ingredient of bread.—2. A stiff formal manner; starchness.

STÄRCH, *a.* Stiff; precise; rigid.

STÄRCH, *v t.* To stiffen with starch.

STÄR-CHĀMBER, *n.* Formerly, a court of civil and criminal jurisdiction at Westminster, so named, it is said, from the roof of the apartment where it was held being ornamented with gilt stars. It was under the direction of the chancellor, and had jurisdiction of forgery, perjury, riots, maintenance, fraud, libel, and conspiracy, and, in general, of every misdemeanour, especially those of public importance, for which the law had provided no sufficient punishment. Its criminal jurisdiction (after its civil jurisdiction had gone into disuse) rendered it a powerful and odious auxiliary of a despotic administration. Its process was summary, and often iniquitous, and the punishment it inflicted often arbitrary and cruel. This court was abolished by statute 16 Charles I.

Municipal law is a rule of conduct prescribed by the supreme power in a *state*. *Blackstone.*

More usually the word signifies a political body governed by representatives; a commonwealth; as, the *States* of Greece; the *States* of America. In this sense, *state* has sometimes more immediate reference to the government, sometimes to the people or community. STAT′ICS, *n.* [Fr. *statique;* L. *statice;* Gr. στατικη.] 1. That branch of mechanics which considers bodies as acted on by forces which are in equilibrium, or which produce equilibrium: or it has for its object the investigation of the conditions under which several forces or pressures applied to a rigid body mutually destroy each other. It thus stands opposed to *dynamics*, in which the effects of forces producing motion are investigated. Statics is subdivided into the statics of rigid and of fluid bodies, the latter being called hydrostatics. The two great propositions in statics are that of the lever, and that of the composition of forces, but it also comprehends all the doctrines of the excitement and propagation of forces or pressures, through the parts of solid bodies by which the energies of machines are produced. It teaches us the intensities and directions of all such pressures; and how much remains at the working point of a machine unbalanced by resistance. It comprehends every circumstance which influences the stability of heavy bodies; the investigation and properties of the centre of gravity; the theory of the construction of arches, vaults, and domes; the attitudes of animals. It also comprehends the strength of materials, and the principles of construction, so as to make the proper adjustment of strength and strain in every part of a machine, edifice, or structure of any kind.—2. Statutes are either public or private but the term is usually restricted to public acts, of a general and permanent character. Statutes are said to be *declaratory* of the law as it stood before their passing; *remedial*, to correct defects in the common law, and *penal*, imposing prohibitions and penalties.—*Statutes of the realm*, a body of enactments contained in three volumes, preserved in the court of exchequer, and now in the custody of the master of the rolls. One volume contains the statutes passed before the beginning of the reign of Edward III.; and the other two, those from 1 Edward III. to 7 Henry VIII., all very fairly written. — *Statutes of limitation*, statutes for establishing the limitations of actions in the English law. *Statutes* are distinguished from *common law*. The latter owes its binding force to the principles of justice, to long use, and the consent of a nation. The former owe their binding force to a positive command or declaration of the supreme power. *Statute* is commonly applied to the acts of a legislative body consisting of representatives. In monarchies not having representative bodies, the laws of the sovereign are called *edicts*, *decrees*, *ordinances*, *rescripts*, &c.—2. STEAM, *n.* [Sax. *steam*, *stem*; D. *stoom*.] 1. The vapour of water; or the elastic aeriform fluid generated by heating water to the boiling point. When water in an open vessel is heated to the temperature of 212°, or to the boiling point, globules of steam are formed at the bottom, and rise to the surface; and the continued application of heat, even though increased indefinitely, will only cause a more copious and rapid formation of steam, and will finally evaporate the whole of the water, without raising the temperature of either. In this case, all the heat which enters into the water is solely employed in converting it into steam of the temperature of boiling water. But if the water be confined in a strong close vessel, both it and the steam which it produces may be brought to any temperature; and as steam at 212° occupies nearly 1700 times the space of the water from which it is generated, it follows that, when thus confined, it must exercise an enormous elastic or expansive force; which may also be shown to be proportional to its temperature. When the temperature is considerably above 212°, the steam formed under such circumstances is termed *high pressure steam*; at 212° it is termed *low pressure steam*, and its pressure is equal to that of the atmosphere, or 15 lbs. on the square inch. Steam in its perfect state is transparent, and constantly invisible; but when it has been deprived of part of its heat by coming into contact with cold air, it suddenly assumes a cloudy appearance, and is condensed into water. Hence appears another important property of steam, its condensibility; so that whenever cold is applied to it, it suddenly returns to the liquid state, and thus can be employed to produce a vacuum. From the properties above briefly adverted to, steam constitutes an invaluable agent for the production of mechanical force, as exemplified in the vast and multiplied uses of the steam-engine. Steam is also employed as an agent in distributing the heat used for warming buildings, in heating baths, evaporating solutions, distilling, brewing, drying, dyeing, and even for domestic cookery. It is also the means of extracting wholesome and nutritious food from most unpromising and unpalatable substances.—2. In *popular usage*, the visible moist vapour which rises from water, and from all moist and liquid bodies, when subjected to the action of heat; as, the *steam* of boiling water, of malt, of a tan-bed, &c. This is properly water in a minute state of subdivision arising from the condensation of steam.

Steam-engine boilers are constructed of various forms, the most common being waggon-shaped, egg-shaped, cylindrical, and tubular. The best material for boilers is copper; but wrought-iron-plate is most commonly employed in this country on account of its cheapness.

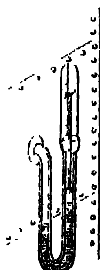
STEAM-ENGINE, *n.* An engine worked by steam; or an engine in which the mechanical force arising from the elasticity and expansive action of steam, or from its property of rapid condensation, or from the combination of these principles, is made available as a source of motive power in the arts and manufactures, and in locomotion. The invention of the steam-engine, which has exerted such a vast influence upon the state of society in modern times, by the impulse it has given to industry, and the facilities it has afforded for intercourse among men, whether by land or by sea, has been universally ascribed, by the English, to the Marquis of Worcester, who published an account of it about the middle of the 17th century. By the French, the invention has been ascribed to Papin, towards the close of the same century. There can be little doubt, however, that steam was employed as an impelling power, to some small extent, more than thirty years previous to the date of the Marquis of Worcester's invention. The first actual working steam-engine of which there is any record, was invented and constructed by Captain Savery, an Englishman; to whom a patent was granted for it in 1698. This engine was employed to raise water by the expansion and condensation of steam. The steam-engine received great improvements from the hands of Newcomen, Beighton, Blakey, and others. Still, however, it was im-

perfect and rude in its construction, and was chiefly applied to the draining of mines or the raising of water. The steam-engine was brought to its present high state of perfection by the celebrated James Watt, about the year 1782. The numerous and vital improvements introduced by him, both in the combination of its mechanism, and in the economy of its management, have rendered the steam-engine at once the most powerful, the most easily applied and regulated, and, generally speaking, the least expensive of all prime movers, for impelling machinery of every description. Steam-engines vary much in magnitude, form, and proportions, as well as in the details of the machinery by which the power of the steam is applied. In short, the form of the engine, the arrangement and construction of its parts, its power, &c., depend entirely on the purpose to which it is to be applied, and may be indefinitely diversified. The subjoined illustration represents a sectional elevation of a *Portable Condensing Steam-Engine.* steam thus admitted is instantly deprived of its heat, and re-converted into its original form of water, thereby forming a vacuum. Thus it will be seen that, on the communication being opened up between the boiler and either side of the piston, the latter will ascend or descend in the cylinder unimpeded by the resistance of the atmosphere against the other side, and with a force proportional to the pressure of the steam; and as the motions of the steam valve *l* are regulated by the engine itself, the above action is kept up continuously. The alternating rectilinear motion thus generated within the cylinder is transmitted, by means of a rod attached to the piston, to a strong beam *f, f*, movable upon a central axis; a system of jointed rods *e, e*, called the *parallel motion*, being interposed for the purpose of neutralizing the disturbing action which the circular path of the beam would otherwise exert upon the piston. The reciprocating motion of the beam is now, through the intervention of the connecting rod *g*, and crank *h*, converted



Portable Condensing Steam-Engine.

a, The steam cylinder; *b*, the piston; *c*, the upper steam port or passage; *d*, the lower steam port; *e, e*, the parallel motion, *f, f*, the beam; *g*, the connecting rod; *h*, the crank; *i, i*, the fly-wheel; *k, k*, the eccentric and its rod for working the steam valve; *l*, the steam valve and valve casing; *m*, the throttle valve; *n*, the condenser, *o*, the injection cock, *p*, the air-pump; *q*, the hot well; *r*, the snifting-valve, for creating a vacuum in the condenser previous to starting the engine; *s*, the feed pump for supplying the boilers; *t*, the cold water pump for supplying the condenser cistern; *u*, the governor.

The construction and action of the steam-engine will be readily understood from the above sketch. The pipe which conveys the steam from the boiler opens into the part marked *l*, which incloses a movable valve by means of which the steam may be alternately admitted into the cylinder *a*, by the upper port, *c*, and lower, *d*; between these points the piston *b* works steam tight. The valve *l* is so contrived, that while it allows steam to pass into the cylinder through one of the ports, it shall at the same time open a communication between the *opposite* side of the piston and the condenser *n*. which is a hollow vessel kept constantly immersed in cold water, a portion of which is admitted into it by the injection cock, *o*; consequently the into a circular or rotatory motion, which is rendered continuous and uniform by the fly-wheel *i*, to the axis of which the machinery to be impelled is connected. The air-pump *p*, for withdrawing the vapour and water from the condenser; the feed pump *s*, for supplying the boilers, and the cold water pump *t*, for supplying the condenser cistern, are all worked by rods from the beam; and the governor *u*, for maintaining uniformity of motion, is driven by a band from the crank shaft. The above description refers more immediately to that class of steam-engines called *low pressure*, or *condensing* engines, in which the power derived from the rapid condensation of the steam is made available in combination with that due to its elasticity; but if we supposed the condensing apparatus removed, and the waste steam allowed to escape into the atmosphere, it will then be equally applicable to that kind called *high-pressure* engines, which employ the elastic action of the steam alone. The latter class, on account of their greater simplicity of parts and lightness, are exclusively employed for the purposes of locomotion on railways; while the former, from their superior economy and safety, are generally preferred in this country as *stationary* engines for driving machinery, and *marine* engines for propelling steam-boats. The form of the steam-engine is susceptible of an endless variety, according to the purposes to which it is to be applied; its mechanical energy is usually estimated in *horse power*, [*see* HORSE POWER] and is proportioned to the pressure of the steam, the area of the piston, and the velocity at which it moves. The stupendous effects which have resulted from the application of the power of steam in recent times, are striking attestations of the immense value of the invention. By the agency of steam, the seas are now navigated in defiance of wind and tide; the earth is made to yield up in lavish abundance its metals and minerals; vast marshes are drained, and land before barren rendered fruitful; communities are brought into closer connection with communities; fresh and inexhaustible sources of wealth and comfort are elicited; new combinations of human industry and ingenuity are brought into requisition; knowledge is widely scattered abroad; distance is lessened by velocity of locomotion; and time itself become more precious Thus by infinitely enlarging the sphere of useful action to whatsoever was useful before, and by diffusing among millions what previously was attainable only by the few, this agent has wrought a change of aspect in kingdoms, in commerce, and in the individual relations of society, to an extent so wide, and in a time so brief, that the history of the world bears no parallel to it in influence.

STEAMER, *n.* A vessel propelled by steam; a steam-ship.—2. A vessel in which articles are subjected to the action of steam, as in washing or cookery.

STEAM-GAUGE, *n.* An instrument for indicating the pressure within a steam-boiler, by means of a bent tube partially filled with mercury, one end of which springs from the boiler, while the other is exposed to the air; so that the steam, by its pressure, raises the mercury in the straight limb of the tube to a height above the common level, proportioned to that pressure. An iron float and index are usually added for the convenience of observation, as shewn in the annexed figure.

Steam-Gauge.

STEAM-GOVERNOR. *See* GOVERNOR.

STEAM-GUN, *n.* A contrivance for projecting balls or other projectiles used in warlike operations, by means

of steam in place of gunpowder. It bears some analogy to the air-gun. The invention is due to Mr. Jacob Perkins, but it has never been submitted to the test of actual experience either in military or naval operations; and it requires too much extraneous apparatus to be conveniently movable.

STEAMING, *ppr.* Exposing to steam; cooking or dressing by steam; preparing for cattle by steam, as roots.

STEAM-WHISTLE, *n.* A contrivance attached to locomotives for giving warning of the starting of the train, of its approach to a tunnel or station, &c. The annexed figure represents a section of a steam-whistle; *a*, *a*, is a tube fixed to the top of the boiler, and opening into its interior; it is commanded by a stop cock, *e*; the tube is surmounted by a hollow piece *b*, perforated with holes, and surrounded by a thin brass cup *c*, *c*; the respective diameters of the piece *b*, and cup *c*, being so adjusted as to leave a very narrow orifice all round. Another thin brass cup *d*, is fixed in an inverted position at a short distance above the upper surface of the parts *b* and *c*, so as to present a sharp edge exactly opposite the orifice above mentioned. On opening the stop-cock, *e*, the steam, rushing with great violence through the circular orifice, encounters the edge of the cup, *c*, and thereby produces a loud and shrill sound which may be heard at the distance of several miles.

STE'ARATE, *n.* A compound formed by the union of stearic acid with a salifiable base. The neutral stearates of the alkalies are perfect soaps.

STEA'RIC ACID, *n.* A bibasic acid, perhaps the most important and most abundant of the fatty acids. It exists in combination with glycerine, as stearine, in beef and mutton fat, and in several vegetable fats, such as the butter of cacao. It is obtained from stearine by saponification, and also from mutton suet by a similar process. Stearic acid is in the form of brilliant white, scaly crystals; it is inodorous, tasteless, insoluble in water, but soluble in alcohol and ether. It burns like wax, and is used in the formation of improved candles. It is composed of 68 equivalents of carbon, 66 of hydrogen, and 5 of oxygen. It forms compounds with the alkalies, earths, and metallic oxides, which are called stearates.

STE'ARINE, *n.* [Gr. στεαρ, suet.] The chief ingredient of suet and tallow, or the harder ingredient of animal fats, oleine or elaine being the softer one. It is obtained from mutton suet, melted with ten times its weight of ether in a water-bath. It may also be obtained by pressing tallow between hot plates, and afterwards dissolving in hot ether, which on cooling deposits the stearine. It has a pearly lustre, is soft to the touch, but not greasy. It is insoluble in water, but soluble in hot alcohol and ether. It is separable into stearic acid and glycerine, and when boiled with alkalies, is saponified; that is, the stearic acid combines with the alkali, forming soap, and glycerine is separated. When melted it resembles wax.

STE'ARONE, *n.* A substance obtained by the partial decomposition of stearic acid. It is a volatile liquid, and seems to be stearic acid deprived of two equivalents of carbonic acid.

It is found in metalliferous veins, with the ores of copper, lead, zinc, silver, and tin. It is a hydrated silicate of magnesia and alumina. It is used in the manufacture of porcelain, in polishing marble, &c.; as the basis of cosmetic powders; in the composition of crayons, &c.

STEEL, *n.* [Sax. *style;* G. *stahl;* probably from setting, fixing, hardness; G. *stellen.*] 1. Iron combined with a small but definite portion of carbon. It is called, in chemistry, carburet of iron. The relative proportions of iron and carbon vary in steel of different qualities; but in that used for ordinary purposes, the carbon rarely exceeds two per cent., and is generally below it. The best steel is manufactured from Swedish and Russian bar-iron, by a process called *cementation.* Steel is less malleable than iron, but it is harder, more sonorous, and elastic, susceptible of a higher polish, and less liable to rust. When heated to redness, it can be hammered into various forms, and it can also be welded to another piece of steel or iron. Steel formed from bar-iron by cementation is called *blistered* steel, from its surface acquiring a *blistered* character in the process. When blistered steel is rolled or beaten down into bars, it is called *shear-steel*, and if it be melted, cast into ingots, and again rolled out into bars, it forms *cast-steel*, which, when well prepared, is superior to the other kinds of steel. — *Natural*, or *German-steel*, is an impure and variable kind of steel procured from cast-iron, or obtained at once from the ore. The natural steel yielded by cast-iron, manufactured in the refining houses, is known by the general name of *furnace-steel*, and that which has only been once treated with a refining furnace is particularly called *rough-steel.* The peculiarity of steel, upon which its high value in the arts in a great measure depends, is its property of becoming hard after being heated to redness, and then suddenly cooled by being plunged into cold water, and of being again softened down to any requisite degree, by the application of a certain temperature. This process is called *tempering.* It is found that the higher the temperature to which steel is raised, and the more sudden the cooling, the greater is the hardness; and hence, any degree of hardness can be given to steel which is required for the various purposes to which it is applied. According to the degree of hardness to which steel is tempered, it assumes various colours, and formerly these colours served as guides to the workman. Now, however, a thermometer, with a bath of mercury or oil, is employed, and the operation of tempering is performed with a much greater degree of certainty. The uses of steel in forming various kinds of instruments, edge-tools, springs, &c., are well known.—*Indian-steel.* [*See* WOOTZ.]—2. *Figuratively*, weapons; particularly offensive weapons; swords, spears, and the like.

Steelyard.

The principle of the steelyard is that of the lever; where an equilibrium is produced, when the products of the weights on opposite sides into their respective distances from the fulcrum, are equal to one another. Hence a less weight is made to indicate a greater, by being removed to a greater distance from the fulcrum. For weighing heavy loads, the steelyard is a convenient instrument, but for smaller weights it is less accurate than the common balance.

STEM, *n.* [Sax. *stemn;* G. *stamm*, stock, stem, race. The Latin has *stemma*, in the sense of the stock of a family or race. The primary sense is to set, to fix.] 1. The principal body of a tree, shrub, or plant of any kind; the main stock; the firm part which supports the branches; the ascending axis, which grows in an opposite direction to the root or descending axis. The stem is composed of fibrous, spiral, and cellular tissues, arranged in various ways, mostly assuming a cylindrical form, and having a perpendicular direction, and bearing upon it the various parts of the plant. Its form and direction, however, are subject to much variation in particular cases. In regard to internal structure, there are three principal modifications of stems characteristic of the three great natural classes into which the vegetable kingdom is divided, namely, exogens, endogens, and acrogens. [*See these terms.*] In some plants the stem is so short as to seem to be wanting, the leaves and flower-stalks appearing to spring from the top of the root. In this case, the plant is said to be *stemless*, (*acaulis.*) There are also stems, such as the *rhizoma* and *tuber*, which being subterranean, have been mistaken for roots. The direction, form, texture, consistency, and clothing of stems, produce an almost endless variety in this organ, of which the principal kinds, however, may be reduced to eight. Of these four are subterranean, namely, the *cormus*, *tuber*, *rhizoma*, and *creeping-stem;* and four aërial, namely, the *stem*, *trunk*, *stipe*, and *culm*. To these may be added the *runner* and *sucker*. Considered with respect to consistence, a stem may be *herbaceous*, *woody*, *solid*, *spongy*, *succulent*, *stiff*, *brittle*, &c.; with respect to the divisions, it may be *branched*, *alternately branched*, *much branched*, &c.; with respect to direction, it may be *erect*, *prostrate*, *procumbent*, *creeping*, *reclining*, *trailing*, *climbing*, *twining*, &c.; in regard to form, it may be *round*, *compressed*, *square*, *angular*, *jointed*, *knotted*, &c.; in regard to clothing or appendages, the stem may be *leafy*, *naked*, *scaly*, or *winged;* and in regard to surface, it may be *smooth* or *glabrous*, *shining* or *glossy*, *powdery*, *scabrous*, *warty*, *dotted*, *spotted*, *grooved* or *furrowed*, &c.—2. The peduncle of the fructification, or the pedicle of a flower; that which supports the flower or the fruit of a plant; the petiole or leaf-stem.—3. [D. *steven.*] The outside of the stem is usually marked with a scale of feet, according to its perpendicular height from the keel. Its use is to ascertain the draught of water at the fore part, when the ship is in preparation for a sea voyage, &c. *False stem*, that fixed before the right one. When a ship's

stem is too flat, so that she cannot keep the wind well, a false stem is put above to remedy the defect.—6. In *music*, the upright or downright line added to the head of a note, thus. — 7. Short hand is also used for taking down sermons, scientific lectures and public speeches, both in parliament and at the bar. The art of stenography, however, is not to be acquired without the diligent application of many months, and it also requires considerable manual dexterity. Numerous systems of stenography have been invented in more recent times, some of them of great simplicity. [*See* PHONOGRAPHY.]

STER, in composition, is from the Sax. *steora*, a director. [*See* STEER.] It seems primarily to have signified chief, principal or director, as in the L. *minister*, chief servant; but in other words, as in *spinster*, we do not recognize the sense of *chief*, but merely that of a person who carries on the business of spinning.

STERCORA′CEOUS, *a.* [L. *stercoreus*, *stercorosus*, from *stercus*, dung.] Pertaining to dung, or partaking of its nature.

The species consist of various sized trees with soft timber, which are found in tropical parts of the world, with simple or compound leaves, and axillary panicles or racemes of flowers. Several of them are mucilaginous, and others yield fibre, which is converted into ropes, as the bark of *S. guttata*. The seeds of *S. acuminata* afford the *kola* spoken of by African travellers, which, when chewed or sucked, is believed by the natives to increase the flavour of any thing they may subsequently eat or drink. The Gum-Tragacanth of Sierra Leone is produced by the *S. pubescens*. The seeds of *S. chicha* are eaten as nuts

STEREOGRAPH′IC, } *a.* [from *stereography.*]
STEREOGRAPH′ICAL, } Made or done according to the rules of stereography; delineated on a plane; as, a *stereographic* chart of the earth.—*Stereographic projection*, that projection of the sphere which is represented upon the plane of one of its great circles, the eye being situated at the pole of that great circle. The plane on which the points, lines, and circles of the sphere are represented, is called the *plane of projection*, and the point in which the eye is situated is called the *projecting point*. The *primitive circle* is situated in the plane of projection, and the projecting point on the sphere is one of the poles of this great circle; but on the plane of projection, the poles of the primitive are in its centre. In this projection, all circles are projected either into straight lines or circles. Those which pass through the projecting point are projected into straight lines; in every other case the projection is a circle. *A parallel circle* is one whose plane is parallel to the plane of projection; a *right circle* is one whose plane is at right angles to the plane of the primitive, and as it passes through the projecting point, it is projected into a straight line. An *oblique circle* is one whose plane is oblique to that of the primitive. The *stereographic projection* is employed in the construction of maps, and also in astronomical problems. STE′REOTYPE, *n.* [Gr. στερεὸς, fixed, and τυπος, type, form.] 1. Literally, a fixed metal type; hence, a plate of the size of a page, cast from a plaster mould, or otherwise, in which an exact representation of the types has been made, and which by this means is adapted for book-printing. Thus, we say, a book is printed *on stereotype*, or *in stereotype*. In the latter use, the word seems rather to signify the workmanship or manner of printing, than the plate. There are two stereotype processes used in this country. The *Stanhopian*, so called from Earl Stanhope, its improver, and the *patent process*. By the former process, a stucco mould is taken from the page of types, and after being baked, it is immersed in a liquid metal, in its composition resembling type metal. A metallic plate, called a *stereotype plate*, is thus formed in the mould. After being cooled, the plate is dressed, and then is ready for being printed from. By the *patent* process, the mould or matrix is taken from the types by means of layers of paper, interspread with a mixture of chalk and starch. This mould is obtained by the layers of paper being beat into the face of the types, by repeated blows of a suitable brush. The

mould or matrix being hard dried, a metallic plate is obtained from it by a process similar to that used in the Stanhopian method. Stereotyping is of great value as a means for cheapening the price of books; for, by its aid, where repeated editions are required, the outlay for setting up the types has only once to be encountered; as when a work has been stereotyped, a dozen of reprints may be taken from the plates without incurring further expense, except in printing off the sheets. Many works, such as the Penny Magazine, Chambers' Journal, Hogg's Weekly Instructor, &c. &c., could never have been produced either in the quantity or at the price, without the aid of the stereotype process. William Ged, a goldsmith in Edinburgh, was one of the first to practise stereotyping, according to the common acceptation of the word. He is recorded to have commenced about the year 1725. Ged was followed by Tilloch and Foulis of Glasgow, Didot in Paris, Wilson and Earl Stanhope in London.—2. The art of making plates of fixed metallic types, or of executing work on such plates.

The term stock exchange is also applied to the system by which the purchase, sale, and "carrying over" of stock and shares are effected by certain parties called brokers. The members of the stock exchange are divided into two classes, namely, the stock brokers and the stock jobbers. It is the business of the brokers to receive and execute the orders of merchants, bankers, capitalists, and private individuals, who are "out of the house," as the stock exchange is termed amongst its own members. The jobbers remain stationary in the "house," and are ready to act upon the orders thus received by the brokers. They are men possessed of more or less capital, and it is their business to be always prepared to make a price at which they will sell or buy to the brokers whenever the latter present themselves. Thus, a jobber declares he is ready to buy 3 per cent. consols at 85¼, or to sell at 85⅜; so that, in this way, a person willing to buy or sell any sum, however small, has never any difficulty in finding an individual with whom to deal. The jobber's profit is generally ⅛ per cent. or 2s. 6d. for the £100, for which he transacts both a sale and a purchase. The proceedings of the stock exchange are regulated by a committee, who are elected by ballot.

STOCK-GIL'LYFLOWER, *n.* Matthiola, a genus of plants. [*See* MATTHIOLA.] There are several species, natives of Europe and Barbary. Two species, the common Gillyflower (*M. incana*), and great sea stock (*M. sinuata*), are indigenous to Britain. They have been long favourite ornaments of the flower garden, the double species being esteemed for the beauty and deep tints of the flower, and for its delightful odour.

STOCK'HOLDER, *n.* [*stock* and *hold.*] One who is a proprietor of stock in the public funds, or in the funds of a bank or other company.

STOCK'ING, *n.* [from *stock;* Ir. *stoca;* supposed by Johnson to be a corruption of *stocken*, plural of *stock*. But qu.] A garment made to cover the leg. Stockings were anciently made of cloth or milled stuff, sewed together, but they are now invariably knitted, the material being wool, cotton, or silk. They are either knitted by the hand or woven in a frame, so as to form a species of tissue extremely elastic, and readily adapting itself to the part it is employed to cover. The art of knitting stockings appears to have been introduced into England from Spain, about the beginning of the 16th century.

STOCK'ING, *n.* The act of furnishing with stock, the act of storing up.—*Stocking of a pasture*, in *agriculture*, the putting as many head of cattle upon the pasture as it will maintain.

said to have been invented by William Lee, A.M., of St. John's College, Cambridge, in 1589. But in the course of last century, the machine was very greatly improved.

STOCK'-PURSE, *n.* In *milit. lan*, savings made in the outlay of a corps, and applied to regimental purposes.

STOCKS, *n.* [*See* STOCK.] A term applied to the various funds which constitute the national debt. These funds are variously designated, partly according to the rate of interest which the government engages to pay, and partly from the financial operations to which they have been subjected. Thus there are three per cent. stock, or three per cent. consols; three per cent. reduced; three and a half per cent. reduced; four per cent.; long annuities; life annuities, &c. The price of stocks or rates per cent. are the several sums for which £100 of the respective stocks sell at any given time; as each proprietor of stock may transfer his interest to others by sale. Few persons buy or sell stock except through the medium of a broker, but the general practice is to receive their dividends themselves. The dividends on all descriptions of stock are due half yearly, either on the 5th of January, or 5th of July, or on the 5th of April, or 5th of October, and are paid about a week afterwards. — *Time bargains* form a very important portion of the business of the stock exchange. They are bargains to deliver stock on a certain day at a certain price, the seller of course believing that the price will fall, and the buyer that it will rise. When the period for completing the bargain has arrived, a settlement is usually effected without any payment of stock, the losing party simply paying the difference. These bargains are usually made for certain days, fixed by a committee of the stock exchange, called *settling days*, of which there are about eight in the year. The price at which stock is sold to be transferred on the next settling day, is called the price *on account*. Sometimes instead of closing the account on the settling day, the stock is carried on to a future day, on such terms as the parties agree on. This is called a *continuation*, or *carrying over*. Time bargains cannot be enforced in a court of law, and the parties are held to them only by a sense of honour and self-interest, and the fear of exclusion from the stock exchange, which ruins their credit. A defaulter, in the language of the stock exchange, is termed a *lame duck*, and his name is posted for a certain time in the great room. The sellers of time bargains are also technically called *bears*, and the buyers *bulls*; the interest of the former being to beat down prices, and of the latter to raise them.—*Bank stock*, the trading capital of the Bank of England, or that upon which interest is paid to the proprietors. It amounts to £10,914,250, and the interest is 8 per cent.—*East India stock*, the capital belonging to the East India company, which amounts to six millions, and the interest upon it is 10½ per cent. Besides these English funds, shares in many descriptions of foreign stocks, created by loans raised in this country, are constantly for sale in the money-market, as are also shares in railway, canal, mining, and numerous other similar speculations.—2. In *horticulture*, young trees, which are designed for the reception of the grafts or buds from other trees. Stocks are, for practical purposes, divided into three kinds, *crab-stocks*, *free-stocks*, and *dwarf-stocks*. Crab-stocks are those which are grown from the seeds of wild and ungrafted trees; as the cherry, plum, apple, &c. Free-stocks are those which are raised from the seeds or layers of fruit and orchard trees which have been grafted. Dwarf-stocks are those which are raised from low-growing shrubby-trees, and are used in the grafting of low-standards, and also for wall-trees and espaliers. Stocks are raised in nurseries from seeds, suckers, layers, and cuttings, and may be used when they have attained the size of a goose quill, up to that of a man's finger.—3. A frame erected on the shore of a river or of the sea, and in the large establishments, in the inside of docks, for the purpose of building ships. It generally consists of a number of solid wooden blocks, ranged parallel to each other at convenient distances, upon a very firm foundation, and with a gradual declivity towards the water, for the purpose of launching.—4. STO'IC, *n.* [Gr. στωικος, from στοα, a porch in Athens, where the philosopher Zeno taught.] A disciple of the philosopher Zeno, who founded a sect. He taught that men should be free from passion, unmoved by joy or grief, and submit without complaint to the unavoidable necessity by which all things are governed. The Stoics are proverbially known for the sternness and austerity of their ethical doctrines, and for the influence which their tenets exercised over some of the noblest spirits of antiquity. Their system appears to have been an attempt to reconcile a theological pantheism, and a materialist psychology, with a logic which seeks the foundations of knowledge in sensible experience, and a morality which claims as its first principle the absolute freedom of the human will. "Live according to nature" is, with the stoics, the expression of the coincidence which ought to exist between the human will and the universal reason, which they identified with the life and power of nature. This coincidence is virtue, the only good; as vice, its opposite, is the only evil. All things else are in themselves indifferent; being approved or disapproved only by comparison. Virtue, according to them, is the perfect harmony of the soul with itself; vice is, in its essence, inconsistent and self-contradictory. The wise man, the ideal of human perfection, is absolutely and without qualification, free. His actions are determined by his free will, with a power as irresistible as that by which universal nature is guided and animated.

STŎMAƐH, *n.* [L. *stomachus;* Fr. *estomac.*] 1. In *animal bodies*, a membranous receptacle, the principal organ of digestion, in which food is prepared for entering into the several parts of the body for its nourishment. The human stomach is of an irregularly conical form; it is situated in the epigastric region, lying almost transversely across the upper and left portion of the abdominal cavity. Its largest extremity is directed to the left, its smaller to the right. Its superior orifice, where the œsophagus terminates, is called the *cardia;* the inferior orifice, where the intestine begins, the *pylorus*. The stomach, like the intestinal canal, is composed of three coats or membranes, connected by a firm but very extensive cellular tissue. The external or *peritoneal* coat is a dense firm membrane; the internal or *villous* coat is soft, mucous, and vascular; the central coat is muscular, and the glands of the stomach are situated between it and the villous coat. The arteries of the stomach come chiefly from the cœliac artery, and are accompanied by veins which terminate in the *venæ portæ*. The nerves of the stomach are very numerous, and come from the eighth pair and the sympathetic nerve. The lymphatic vessels are distributed throughout the whole substance, and proceed immediately to the thoracic duct. The use of the stomach is to excite hunger and partly thirst; to receive the food from the œsophagus, and to retain it, till by the motion of the stomach, the admixture of various fluids, and many other changes, it is rendered fit to pass the right orifice of the stomach, and be converted into chyle in the intestines.—2. It resembles the common syringe, except that it has two apertures near the end, instead of one, in which the valves open different ways, so as to constitute a *sucking* and a *forcing* passage. When the object is to extract from the stomach, the pump is worked, while its sucking orifice is in connection with a flexible tube passed into the stomach; and the extracted matter escapes by the forcing orifice. When it is desired, on the contrary, to throw cleansing water or other liquid into the stomach, the tube is connected with the forcing orifice, by which the action of the pump is reversed.

STŎM'AƐH STAGGERS, *n.* A disease in horses, depending on a paralytic affection of the stomach. In this disease the animal dozes in the stable and rests his head in the manger; he then wakes up, and falls to eating, which he continues to do till the stomach swells to an enormous extent, and the animal at last dies of apoplexy, or his stomach bursts.

They are found chiefly in intertropical climates.

STONE, *n.* [Sax. *stan;* Goth. *staina;* G. *stein;* D. and Dan. *steen.* This word may be a derivative from the root of *stand.* The primary sense is to set, to fix; Gr. στιαι.] 1. A hard concretion of some species of earth, as lime, silex, clay, and the like; a hard compact body, of any form and size. In *nat. hist.*, stones, as distinguished from simple minerals, are defined to be essentially compound fossils; found in continued strata, or beds, of great extent, formed either of congeries of small particles, in some degree resembling sand, and lodged in a smoother cementitious matter, both of these running together into one smooth mass; or, finally, of granules cohering by contact, without any cementitious matter among them: or composed of crystal or spar, usually debased by earth, and often mixed with talc, and other extraneous particles. The principal component parts of stones are silex, alumina, zirconia, glucina, lime, and magnesia; sometimes the oxides of iron, manganese, nickel, chromium, and copper, are also found to enter into their composition. In popular language, very large masses of concretions are called *rocks;* and very small concretions are universally called gravel or sand, or grains of sand. Stones are of various degrees of hardness and weight; they are brittle and fusible, but not malleable, ductile, or soluble in water. Stones are of great and extensive use in the construction of buildings of all kinds, for walls, fences, piers, abutments, arches, monuments, sculpture, and the like. The qualities requisite for a building stone are hardness, tenacity, and compactness. When we speak of the substance generally, we use *stone* in the singular; as, a house or wall of *stone.* But when we speak of particular separate masses, we say, *a stone,* or *the stones.*—2. It consists of two circles and two ovals, composed of huge stones, uprights and imposts. The outer or largest circle is 105 feet in diameter, and between it and the interior smaller circle is a space of about 9 feet. Within this smaller circle, which is half the height (8 feet) of the exterior one, was a portion of an ellipse, formed by five groups of stones, which have been called *trilithons,* because formed by two vertical and one horizontal stone. Within this ellipse is another of single stones, half the height of the trilithons. The outer circle was

originally composed of thirty upright stones, at nearly equal distances apart; sustaining as many stones in a horizontal position, forming a continuous impost. The inner circle consisted of about the same number of upright stones of smaller size, and without imposts. Within the inner elliptical enclosure was a block of stone, 16 feet long, 4 feet broad, and 20 inches thick. This has usually been called the altar stone. Round the larger circle, and at the distance of 100 feet, was a vallum 52 feet in width, and 15 in height. Nothing is known respecting the date of the erection of this wonderful monument of antiquity. It has been conjectured that the priests of the ancient Britons were priests of Baal, and hence that Stonehenge was a temple for the worship of Baal.

The choir-organ usually contains the *stopt diapason*, the *dulciana*, the *principal*, the *flute*, the *twelfth*, the *bassoon*, and the *vox humana*. The stops of an organ are so arranged, that by means of registers the air proceeding from the bellows may be admitted to supply each stop or series of pipes, or excluded from it at pleasure; and a valve is opened when the proper key is touched, which causes all the pipes belonging to the note, in those series of which the registers are open, to sound at once. Several of the stops are designed to produce imitations of different musical instruments, as the *trumpet*, *clarion*, *cornet* and *flute stops*.—8. Regulation of musical chords by the fingers.

affection towards its young; and, according to popular belief, for its attention towards its parents in old age. The black stork (*C. nigra*) occurs in Poland and Prussia, and in the sequestered parts of the Alps. STORM, *n.* [Sax. *storm;* D. Dan. and Sw. *storm;* G. *sturm;* W. *ystorm;* D. *stooren*, to disturb; W. *ystwriaw*, Eng. to *stir.* In Italian, *stormo* is a fight, combat, a band, or troop; *stormire*, to make a noise; *stormeggiare*, to throng together, to ring the alarm bell. The Italian seems to be from L. *turma.* The primary sense of storm is a rushing, raging, or violent agitation.] 1. A violent wind; a tempest; a violent commotion of the atmosphere. Thus a *storm of wind* is correct language, as the proper sense of the word is rushing, violence. It has primarily no reference to a fall of rain or snow. But as a violent wind is often attended with rain or snow, the word *storm* has come to be used, most improperly, for a fall of rain or snow without wind.

O beat those *storms* and roll the seas in vain. *Pope.*

Law of storms. The causes of those violent commotions of the atmosphere to which we give the name of storms, tempests, hurricanes, tornados, &c., have particularly engaged the attention of natural philosophers for several years past; but their causes are involved in great obscurity, chiefly owing to the difficulty of obtaining a precise knowledge of the various circumstances with which storms are accompanied. It is in the torrid zone that storms display the greatest violence, and rage with most destructive fury. In temperate regions they are comparatively rare, and in the polar regions they seldom amount to more than a strong wind. From the observations of Mr. Redfield of New York, the following general phenomena respecting storms which occur in the northern hemisphere, appear to be established:—1. The severest hurricanes originate in tropical latitudes to the north or east of the West India Islands. 2. They cover simultaneously an extent of surface from 100 to 150 miles in diameter, acting with diminished violence towards the exterior, and increased energy towards the interior of that space. 3. The tract over which the hurricane passes is not a straight line. South of the parallel of 30° north latitude, it proceeds in a westerly course inclined to the north; but when it comes to about this parallel, it changes rather abruptly to the north and eastward, and continues to incline gradually more to the east. The average progressive velocity appears to be from 15 to 25 miles per hour. 4. The duration of a storm at any particular place depends of course on the extent of the mass of agitated air and the progressive velocity, and storms of smaller extent move with even greater rapidity than large ones. 5. The direction of the wind in a hurricane is not in the direction of its progress. When the progressive motion of the storm is westward, the wind at the commencement is from a northern quarter, and during the latter part of the gale, from a southern quarter of the horizon. When the progressive motion is eastward, the phenomena are reversed; the wind blows at first from a southern quarter, and towards the end of the gale from a northern quarter of the horizon. From these phenomena, and particularly the last, Mr. Redfield concludes that the great body of the storm whirls in a horizontal circuit round a vertical or somewhat inclined axis of rotation, which is carried forward with the storm; and that to a spectator placed at the centre, the direction of the rotation is invariably from right to left. Colonel Reid, of the engineers, has investigated the subject of storms with great care and minuteness, and the results of his investigations he considers as in all respects confirming the conclusions of Mr. Redfield. He has also given an account of several great hurricanes in the southern hemisphere, from which it appears that the southern storms follow exactly the same law as the northern, but in a reversed order. Colonel Reid conjectures that the force and frequency of storms may have some connection with the law of magnetic intensity. A knowledge of the general laws which regulate the phenomena of storms would be of immense importance, inasmuch as it would enable the navigator to avoid those tracts of the ocean in which they chiefly prevail at particular seasons, or at least, if surprised by a storm, to steer on the course by which he may soonest escape from it, or fall into its wake. But the term *stove* is usually restricted to those contrivances for heating apartments in which the fire is enclosed so as to exclude it from sight, the heat being given out through the material of which the stove is composed, and the smoke conveyed away by means of a pipe leading from the stove. Stoves are of various constructions, and numerous patents have been taken out for inventions and improvements upon them. In the German stoves, the heated air before it finally enters the chimney is made to circulate through various chambers constructed over the fire box, to which it communicates much of its excess of heat, and those again impart it to the surrounding air. Sometimes buildings are warmed by sending up currents of hot air from stoves placed in the basement story.—4. An iron box with various apartments in it for cooking; a culinary utensil of

various forms.—5. In *horticulture*, a structure in which plants are cultivated which require a considerably higher temperature than the open air in Britain and similar climates. STRATH'SPEY, *n.* In *Scotland*, a species of dance in which two persons are engaged. It is so denominated from the country of Strathspey, probably as having been first used there. —2. A species of dance music in common time, peculiar to Scotland. It probably originated in the same district as the above dance, and at the same

time, but it is not now confined to that dance.

STRATIFICA'TION, *n.* [from *stratify.*] The process by which substances in the earth have been formed into strata or layers.—2. The arrangement of substances in strata or layers; one upon another, like the leaves of a book; as the *stratification* of rocks.—3. The act of laying in strata.

STRAT'IFIED, *pp.* Arranged or disposed in layers or strata, as *stratified rocks.* Rocks are divided into *stratified* and *unstratified.* Stratified rocks are those which are disposed in layers one above the other; as, slates, sandstones, limestones. Unstratified rocks appear in masses, without any such arrangement as that exhibited by the stratified rocks. Granite, greenstone, and lava belong to the latter class.

STRA'TIFORM, *a.* In the form of strata.

STRAT'IFY, *v. t.* [Fr. *stratifier*, from L. *stratum.*] 1. To form into a layer, as substances in the earth. Thus clay, sand, and other species of earth are often found *stratified.*—2. To lay in strata.

STRAT'IFYING, *ppr.* Arranging in a layer, as terrene substances.

STRATIGRAPH'ICAL, *a.* Belonging to stratography.

STRATIGRAPH'ICALLY, *adv.* In a stratigraphical manner.

STRATIO'TES, *n.* A genus of aquatic plants, nat. order Hydrocharaceæ. There is only one species a native of Britain, the *S. aloides* or water-soldier, which grows in lakes, pools, and ditches. It is a singular plant, with numerous sword-shaped leaves and white flowers, from a compressed two-leaved spathe.

STRATOT'IC, *a.* Warlike; military.

STRA'TUM, *n.* plur. *Strata.* [L. from *sterno*, to spread or lay; Sax. *streone.*] 1. In *geol.* and *mineral.*, a layer of any deposited substance, as sand, clay, limestone, &c., which is spread out over a certain surface by the action of water, or in some cases by wind. The deposition of successive layers of sand and gravel in the bed of a river, or in a canal, affords an illustration both of the form and origin of strata. Some geologists make a distinction between a *stratum* and a bed, restricting the latter term to the thicker kind of strata; others, however, use the terms synonymously. Strata are masses having a much greater extension in two of their dimensions than in the third, and generally occupying large spaces. In its simplest or most perfect form, the stratum may be considered as a great bed or plate, of which the upper and lower surfaces are straight and parallel. But many modifications are observed; for the surfaces may be inclined to each other, so that if prolonged they would terminate in an edge, or the stratum may be thicker at one part than another; or it may be variously bent, undulated, or fractured. While some strata are horizontal, others are perpendicular, and all intermediate degrees of inclination are met with. Strata of sandstone and clay are generally supposed to have been deposited from the turbid waters of the sea, lakes, or rivers, their laminæ being arranged over each other in a regular manner. Others again, as of mica-slate, are supposed to have resulted from chemical precipitation. A stratum may vary in thickness from a few yards to a thousand feet or more. Strata are separated from each other by seams or parallel planes, and sometimes by joints or fissures, forming some angle with the planes. When a stratum does not lie horizontally but is inclined, it is said to *dip* towards some point of the compass, and the angle it makes with the horizon is called the angle of *dip* or inclination. The direction or strike of the strata is indicated by a horizontal line at right angles to the dip. When strata protrude above the surface, or appear uncovered, they are said to *crop out.* They are said to be *conformable*, when their planes are parallel, whatever their dip may be; and *unconformable*, when a set of them are connected with another, so that the planes of stratification of the one series have a different direction from that of the other series. On examining the crust of the earth, we find that it consists chiefly of distinct strata of different materials. These differ in depth and extent, but they are found to follow each other, on the large scale, as masses in an apparently regular and uniform succession, in all places, districts, and countries, where they admit of examination, and have been attentively studied. They appear in most instances to rest upon, and are blended with, invaded, and, in some few instances, overflowed, as it were, by unstratified rocks. Stratified rocks have been divided, according to the order of their deposition, into four groups: 1. Primary; 2. Secondary; 3. Tertiary; 4. Alluvial. The primary or lowermost stratified rocks, such as gneiss, mica slate, clay-slate, quartz, &c., are distinguished from the others by a crystalline structure, and by containing no organic remains. The secondary stratified rocks, commencing with the graywacke, and ending with the chalk, are found to contain remains of plants and animals for the most part extinct. They have been variously grouped and subdivided by geologists. The tertiary stratified rocks include the eocene, miocene, older pliocene, and newer pliocene of Lyell. [*See these terms.*] The alluvial, or recent strata, consist of alluvial, concretionary, coralline, and vegetable deposits.—2. A bed or layer artificially made.

The stalk or stem of certain species of grain, pulse, &c., chiefly of wheat, rye, oats, barley, buckwheat, and peas. When used of single stalks, it admits of a plural, *straws.* *Straws* may show which way the wind blows. We say of grain while growing, the *straw* is large, or it is rusty.—2. A mass of the stalks of certain species of grain when cut, and after being thrashed; as, a bundle or a load of *straw.* In this sense, the word admits not the plural number. Straw is used for various purposes; as for fodder to cattle, as thatch for corn stacks and houses, ropes for securing the thatch of corn stacks, &c.; litter for cattle and horses; and finally, as manure. Wheat-straw is the material chiefly used in the manufacture of straw bonnets for ladies.—3. Any thing proverbially worthless. I care not a *straw* for the play. I will not abate a *straw.*

STRAW'BERRY, *n.* [*straw* and *berry;* Sax. *straw-berie.*] The English name of the fruit and plant of the Fragaria, a genus of plants, nat. order Rosaceæ. The fruit of the Fragaria is one of the most delicious of our summer fruits. The species are perennial plants, throwing out runners; the leaves are trifoliate, each leaflet being coarsely toothed; the receptacle on which is seated the carpels, and which is called the fruit, is round, and assumes a variety of colours, from a scarcely perceptible pink to a dark red. All the species are natives of temperate or cold climates, and are found in Europe, America, and the mountains of Asia. The following species afford the varieties of cultivated strawberries: 1. Wood or Alpine strawberry, *F. vesca*, found wild in woods and on hill sides throughout Europe, and abundant in Great Britain. Of this species there are several varieties cultivated in gardens; as the red, the white, the American, and Danish Alpine strawberries; the red wood strawberry, the white wood strawberry, and the red and white Alpine bush strawberry. 2. The hill strawberry, *F. collina*, a native of Switzerland and Germany. The varieties of strawberries called green, are the produce of this species. 3. It is the parent of a great number of sorts known in gardens, most of which are much prized, as the black, brown, and common hautbois, the globe, the large flat hautbois, the long-fruited muscatella, and Sir Joseph Banks. 4. Virginian strawberry, *F. virginiana*, a native of Virginia. To this species belongs the great list of sorts, cultivated in gardens, and known by the name of scarlet and black strawberries. The various kinds of scarlet, globe, cone, and some pine strawberries are produced from this species. 5. Large flowered strawberry, *F. grandiflora*, a native of Surinam, which has furnished our gardens with the sorts called pine strawberries. 6. Chili strawberry, *F. chilensis*, a native of Chili and Peru, and the parent of a number of mostly inferior strawberries. Strawberries, when ripe, may be eaten in almost any quantity without injury. They are frequently eaten mixed with sugar and cream or wine. When ripe and well grown they hardly require such additions; but when their sugar is deficient, this may be safely added, and the addition of wine, under these circumstances, should be preferred to cream, as the latter is very liable to disagree with disordered stomachs.

There are various kinds of plait in general use, some of which are composed of entire straws, and others of split straws. The straw chiefly used for plait is that of the *triticum turgidum*, a variety of bearded wheat, cultivated in Italy between Leghorn and Florence.

STRAW′-ROOFED, *a.* Having a roof of straw.

STRAW′-ROPE, *n.* A rope made of straw twisted, and used to secure the thatch of corn ricks and stacks, and also the thatch of the poorer description of cottages.

STRAW′Y, *a.* Made of straw; consisting of straw.—2. Like straw; light.

STRAY, *v. i.* [The elements of this word are not certainly known. STRENGTH, *n.* [Sax. *strength*, from *streng*, strong. *See* STRONG.] 1. That property or quality of an animal body by which it is enabled to move itself or other bodies. We say, a sick man has not *strength* to walk, or to raise his head or his arm. We say, a man has *strength* to lift a weight, or to draw it. This quality is called also *power* and *force*. But *force* is also used to denote the effect of strength exerted, or the quantity of motion. *Strength*, in this sense, is positive, or the power of producing positive motion or action, and is opposed to *weakness*. In *mech.*, the strength of animals is the muscular force or energy which they are capable of exerting. It is a matter of much importance to be able to estimate, with tolerable accuracy, the effort which an animal of the average strength employed in labour is capable of exerting under different circumstances, because the results afford data for determining the modes in which animal labour may be most advantageously employed. In order to compare the effects produced by different animals, or the same animal under different circumstances, it is usual to estimate the force required to raise or transport 1 pound through one foot of space in a minute of time, which force is called the *dynamic unit*. Hence if an animal, as a horse, for example, is capable of raising 33,000 pounds one foot high in a minute, he must exert a force 33,000 times greater than that required to raise one pound through the same space in the same time. Of the different modes of estimating human strength, the most practically useful is the observation of the average effect produced daily by a labourer, who continues his exertions for a number of successive days, as in transporting materials in a wheel-barrow, carrying a load, or dragging a load, working a pump, turning a winch, ringing a bell, rowing a boat, &c. On comparing the strength of men in different countries it has been found that the English are the strongest.—2. Firmness; solidity or toughness; the quality of bodies by which they sustain the application of force without breaking or yielding. Thus we speak of the *strength* of a bone, the *strength* of a beam, the *strength* of a wall, the *strength* of a rope. In this sense, *strength* is a passive quality, and is opposed to *weakness* or *frangibility*. In *mech.*, the strength of materials is the resistance which bodies oppose to a force acting on them. This resistance can only be ascertained by experiment. [*See* MATERIAL, STRAIN, STRESS.] The strength of bodies depends on their magnitude, form, and position, as well as on the degree of cohesion in the material.—3. Power or vigour of any kind.

This act
Shall crush the *strength* of Satan. *Milton.*
Strength there must be either of love or war. *Holyday.*

Methinks I feel now *strength* within me rise. *Milton.*

8. Force of writing; vigour; nervous diction. The *strength* of words, of style, of expression, and the like, consists in the full and forcible exhibition of ideas, by which a sensible or deep impression is made on the mind of a hearer or reader. It is distinguished from *softness* or *sweetness*. *Strength* of language enforces an argument, produces conviction, or excites wonder or other strong emotion; *softness* and *sweetness* give pleasure.

And praise the easy vigour of a line,
Where Denham's *strength* and Waller's sweetness join. *Pope.*

9. Vividness; as, *strength* of colours or colouring.—10. Spirit; the quality of any liquor which has the power of affecting the taste, or of producing sensible effects on other bodies; as, the *strength* of wine or spirit; the *strength* of an acid.—11. The virtue or spirit of any vegetable, or of its juices or qualities.—12. Legal or moral force; validity; the quality of binding, uniting, or securing; as, the *strength* of social or legal obligations; the *strength* of law; the *strength* of public opinion or custom.—13. 2. Force or violence; as, *stress* of weather.—3. Force; violence; strain.

Though the faculties of the mind are improved by exercise, yet they must not be put to a *stress* beyond their strength. *Locke.*

4. In *mech.*, stress and strain are terms used indiscriminately to express the force which is exerted in any part of a machine or structure of any kind, tending to break it in that part. Thus every part of a rope is equally strained by the weight which it suspends. Every part of a column is equally strained by the load which it supports. A mill axle is equally twisted and strained in every part which lies between the part of the wheel actuated by the moving power, and the part which is resisted by the work to be performed. Every part of a lever or joist is differently strained by a force acting on a distant part. No structure can be made fit for its purpose unless the strength at every part be at least equal to the stress laid on or the strain excited in that part. Hence, in the erection of any machine or structure, it is necessary to ascertain the strains to which the different parts are exposed, and also to determine the strength of the materials which it is necessary to oppose in every part to these strains, and how to oppose this strength in such a manner that it shall be exerted to the best advantage.

STRESS, *v. t.* To press; to urge; to distress; to put to difficulties. [*Little used.*]

STRETCH, *v. t.* [Sax. *streccan*; G. *strechen*; probably formed on the root of *reach*, *right*, L. *rego*, &c.] 1. STRIKE, *v. t.* pret. *Struck;* pp. *Struck* and *Stricken;* but *Struck* is in the most common use. *Strook* is wholly obsolete. [Sax. *astrican*, to strike, D. *stryken*, to strike, and to *stroke*, to smooth, to anoint or rub over, to slide; G. *streichen*, to pass, move, or ramble, to depart, to touch, to *stroke*, to glide or glance over, to lower or *strike*, as sails, to curry, [L. *stringo, strigil,*] to sweep together, to spread, as a plaster, to play on a violin, to card, as wool, to *strike* or whip, as with a rod; *streich, strich*, a stroke, stripe, or lash, Eng. *streak;* Dan. *streg*, a stroke; *stryger*, to rub, to *stroke*, to *strike*, to trim, to iron or smooth, to *strike*, as sails, to whip, to play on a violin, to glide along, to plane; Sw. *stryka*, id. We see that *strike, stroke*, and *streak*, and the L. *stringo*, whence *strain, strict, stricture*, &c., are all radically one word. *Strong* is of the same family. Hence we see the sense is to rub, to scrape; but it includes often the sense of thrusting. It is to touch or graze with a sweeping or stroke. Hence the use of *stricken* applied to age, worn with age, as in the L. *strigo*, the same word differently applied. Hence also we see the propriety of the use of *stricture*, applied to criticism. STRŌKE, *n.* [from *strike.*] A blow; a knock; the striking of one body against another; the act of one body upon another when brought suddenly into contact with it; *applicable to a club, a hammer, a mallet, or to any heavy body, or to a rod, whip, or lash.* A piece of timber falling may kill a man by its *stroke;* a man, when whipped, can hardly fail to flinch or wince at every *stroke.*

> Th' oars were silver,
> Which to the time of flutes kept *stroke.* *Shak.*

The force or intensity of a stroke is directly proportional to the velocity and quantity of matter or weight of the striking body, and to the sine of the angle of incidence, that is, the angle which the direction of the striking body makes with the surface of the body struck. Hence, the greatest effect is produced by a stroke when the angle of incidence is a right angle, or when the striking body is made to move in a direction perpendicular to the surface of the body struck.—2. A hostile blow or attack.

STRON′TIA, *n.* One of the alkaline earths, of which *strontium* is the metallic base. It occurs in a crystalline state, as a carbonate, in the lead mines of Strontian, in Argyleshire, whence its name. It was discovered by Dr. Hope in 1792. It has subsequently been found in England, America, and France; but strontitic minerals are rather rare. The pure earth to which the name of strontia is given, is prepared from the carbonate exactly like baryta. It is a greyish white powder, infusible in the furnace; of a specific gravity approaching that of baryta, having an acrid burning taste, but not so corrosive as baryta, though sharper than lime. It becomes hot when moistened, and slakes into a pulverulent hydrate, dissolves in 150 parts of water at 60°, and in much less at the boiling point, forming an alkaline solution, called *strontia water*, which deposits crystals in four-sided tables as it cools. The dry earth, which is an oxide of strontium, is composed of 44 equivalents of strontium, and 8 of oxygen. It is readily distinguished from baryta, by forming with hydrochloric acid a chloride which crystallizes in needles, and is very deliquescent, and soluble in alcohol, to which it gives the property of burning with a crimson flame. The sulphate of strontia is found native, and some of the native varieties have a pale blue tint, whence the term *cœlestine*. The nitrate of strontia is used in making the red fire of the theatres, and of fire-works; and it is also employed for signal lights.

It is analogous to barium, but has less lustre; it is heavier than sulphuric acid, difficultly fusible, and not volatile. When exposed to the air it attracts oxygen, and becomes converted into strontia, or protoxide of strontium; when thrown into water, it decomposes it with great violence, producing hydrogen gas, and forming with the water a solution of strontia. Strontium is harmless, while barium and all its compounds are poisonous.

Stucco for internal decorative purposes, such as the cornices and mouldings of rooms, and the enrichment of ceilings, is a composition of very fine sand, pulverized marble, and gypsum, mixed with water till it is of a proper consistency. Within a short time after being first applied, it begins to set, or gradually harden, in which state it is moulded, and may at length be finished up with metal tools. The stucco employed for external purposes is of a coarser kind, and variously prepared; the different sorts being generally distinguished by the name of cements. Some of these take a surface and polish almost equal to that of the finest marble. The third coat of three-coat plaster is termed stucco, consisting of fine lime and sand. There is a species called *bastard stucco,* in which a small portion of hair is used. Rough stucco is merely floated and brushed with water, but the best kind is trowelled.—2. Work made of stucco.—3. mouth placed under the snout is small and edentated; the palatal bones, soldered to the maxillaries, convert them into the upper jaw. The mouth, placed on a pedicle that has three articulations, is more protractile than that of a shark. The eyes and nostrils are on the side of the head, and cirri are inserted under the snout. On the back is a single dorsal fin, and the tail is forked. The sturgeons ascend the larger rivers of Europe in great abundance, and are the objects of important fisheries. The flesh of most of the species is wholesome and agreeable food; their ova is converted into caviar, and their air-bladder affords the finest isinglass. The common sturgeon (*Acipenser sturio*), is found in most of the

The great sturgeon (*A. huso*), is found in the Po, and Danube. It frequently exceeds 12 and 15 feet in length, and weighs above 1200 pounds. STUT'TERING, *n.* A stammering; a hesitation of speech; an interrupted articulation, accompanied generally with more or less of straining, and distortion of feature. If owing to a vicious conformation of the tongue or other organ of speech, it is incurable, but when merely spasmodic, the cure is possible and sometimes easy. In some cases it may be relieved at once by avoiding carefully the usual hurried repetition of the same syllable, or by opening the mouth and allowing simple sound to pass, when any one oral position threatens to become spasmodically permanent. Should it arise from the attempt to speak being made while drawing in the breath, or when the chest is not sufficiently inflated, it may be avoided by filling the chest well with air before beginning to speak. A table of articulations, with minute directions as to the proper positions of the organs in pronouncing the different sounds, may likewise in some instances prove useful to the patient.

STYLE, *n.* [L. *stylus;* D. and G. *styl;* Fr. *style* or *stile;* Gr. στυλος, a column, a pen or bodkin; from the root of the Teutonic *stellen*, to set or place.] 1. Manner of writing with regard to language; the peculiar manner in which a person expresses his conceptions. It may be considered as a picture of the ideas which rise in his mind, and of the order in which they are there produced. The distinctive manner of writing which belongs to each author, is called his *style*. Thus, we speak of a harsh *style;* a dry *style;* a tumid or bombastic *style;* a loose *style;* a terse *style;* a laconic or verbose *style;* a flowing *style;* a lofty *style;* an elegant *style;* an epistolary *style*. The style of an author is made up of various minute particulars, which it is extremely difficult to describe, but each of which adds something to the aggregate of qualities which belong to him. The selection and arrangement of words, turn of sentences, syntax, rhythm; the relation, abundance, and the character of his usual figures and metaphors; the usual order in which thoughts succeed each other; the logical form in which conclusions are usually deduced from their premises; the particular qualities most insisted on in description; amplification and conciseness, clearness and obscurity, directness and indirectness, exhaustion, suggestion, suppression;—all these are features of style in the largest sense of the term, in which it seems to comprehend all peculiarities belonging to the manner in which thought is communicated from the writer to the reader. A particular style may belong not only to an individual, but to a body of individuals, allied to each other as belonging to the same school, country, or age. The principal requisites of a good style are purity, perspicuity, vigour, harmony, dignity and beauty.

Yet let some lord but own the happy lines,
How the wit brightens and the *style* refines! *Pope.*

2. Manner of speaking appropriate to particular characters; or, in general, the character of the language used.

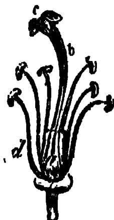
named is. *Sidney.*



According to the usual *style* of dedications. *Middleton.*

So we say, a person addresses another in a *style* of haughtiness, in a *style* of rebuke.—3. In the *fine arts*, the mode in which an artist forms and expresses his ideas on and of a given subject. It is a characteristic essence by which we distinguish the works of one master from those of another. We speak of the *style* of a design, of a composition, of draperies, &c., but we apply the word *manner* to colouring, and harmony of tints. Style in the arts depends on the character of the artist, the subjects, the art itself, the materials used, the object aimed at, &c. The style varies in different periods, and is also influenced by differences of national character. The various branches of an art too have each its peculiar style. Thus in poetry, there are the epic, lyric, and dramatic *styles;* in music, the sacred, opera, and concert *styles*, the vocal and instrumental *styles*, the quartetto, sonata, and symphony *styles*, &c.; in painting, there are the historical, landscape, &c., *styles*.—4. A particular character of music; as, a grave *style;* a lively *style;* a brilliant *style*.—5. Title; appellation; as, the *style* of majesty.

Propitious hear our pray'r,
Whether the *style* of Titan please thee more. *Pope.*

6.† Course of writing.—7. *Style of court*, is properly the practice observed by any court in its way of proceeding. In *Scots law*, *style* is the particular form of expressions and arrangement necessary to be observed in formal deeds and instruments.—8. In *popular use*, manner; form; as, the entertainment was prepared in excellent *style*.—9. A pointed instrument or iron bodkin, used by the ancient Romans for writing by scratching on wax tablets; while the pointed end was used for writing, the other end, which was made blunt and smooth, was employed to make erasures with. From the instrument of writing the term was transferred to the writing itself, and came to signify a particular manner of writing.—10. An instrument of surgery; a probe.—11. Something with a sharp point; a graver; the pin or gnomon of a dial, which projects the shadow on the plane of the dial; written also *stile*.—

12. In *bot.*, the *prolongation* of the summit of the ovary which supports the stigma. Sometimes it is entirely wanting, and then the stigma is *sessile*; as in the poppy and tulip. When the ovary is composed of a single carpel, the style is also single; and the number of styles varies according to the number of carpels; though when the carpels are numerous, the styles may be united. Considered in reference to its direction or position, the style may be *lateral, basal, vertical, included, protruded, ascending*, or *declinate*. Viewed in reference to its form, it may be *filiform, subulate, trigonal, claviform*, or *petaloid*. Viewed with reference to its divisions, it may be *simple* or *divided*; when the divisions do not extend far, it is *slit*; when more prolonged, *partite*. Thus it may be *bifid* or *bipartite, trifid* or *tripartite*, &c. After fecundation the style generally falls off, when it is said to be *caducous*; but when it remains, it is said to be *persistent*.—13. In *arch.*, a particular mode of erecting buildings; as the Gothic *style*, the Grecian *style*, the Moorish *style*, the Norman *style*, &c.—14. In *joinery*. [*See* STILE.]—15. In *chronology*, a mode of reckoning time, with regard to the Julian and Gregorian calendar. Style is *Old* or *New*. The *Old* Style follows the Julian manner of computing the months and days, or the calendar as established by Julius Cesar, in which the year consists of 365 days and 6 hours. This is something more than 11 minutes too much, and in the course of time, between Cesar and Pope Gregory XIII., this surplus amounted to 11 days. Gregory reformed the calendar by retrenching 10 days, and fixing the ordinary length of the civil year at 365 days; and to make up for the odd hours, it was ordained that every fourth year (which we call *leap year*) should consist of 366 days. But the true length of the equinoctial year is only 365 d. 5 h. 48 m. 51·6 s.; hence, four equinoctial years would fall short of four years of 365 d. 6 h. each, or of four Julian years, three of 365 d. and one of 366 d. by 44 m. 33·6 s., and 400 equinoctial years would fall short of 400 Julian years by 74 h. 16 m., or by a little more than three days. This error would very nearly be rectified by omitting three days in three of the four years which completed centuries. Accordingly it was determined, that, dividing time into portions of 400 years, every fourth year, excepting those which terminated the first three centuries of such a period, should be of 366, but that those three, like the common years, should each be of 365 days only. Thus the years 1600, 2000, 2400, would be leap years, or have 366 days, and the years 1700, 1800, 1900, 2100, 2200, 2300, would be common years of 365 days each. This mode of correcting the calendar has been adopted at different times in almost all civilized nations. Russia and Greece are the only countries in which the Old *style* is still adhered to. In England it was adopted by act of parliament in 1752, and as one of the years concluding a century in which the additional or intercalary day was to be omitted (the year 1700) had elapsed since the correction by Pope Gregory, it was necessary to omit 11 instead of 10 days in the current year. Accordingly 11 days in September 1752 were retrenched, and the 3d day was reckoned the 14th. This mode of reckoning time is called New style. The difference between the Old and New styles is now 12 days.

a, Ovary. *b*, Style. *c*, Stigma.

Note.—The word *style* is used in other significations besides those above specified. SUB'JECT, *n.* [L. *subjectus; Fr. sujet;* It. *suggetto.*] 1. One that owes allegiance to a sovereign, and is governed by his laws. The natives of Great Britain are *subjects* of the British government. The natives of the United States, and naturalized foreigners, are *subjects* of the federal government. In *anat.*, a dead body for the purposes of dissection.—*Subject of a proposition,* in *logic,* the term of which the other is affirmed or denied. Thus in the proposition, "Plato was a philosopher," *Plato* is the subject, *philosopher* being its predicate, or that which is affirmed of the subject. SUBLIMA'TION, *n.* In *chem.*, a process by which solid substances are, by the aid of heat, converted into vapour, which is again condensed into the solid state by the application of cold. Sublimation bears the same relation to a solid, that distillation does to a liquid. Both processes purify the substances to which they are severally applied, by separating them from the fixed and grosser matters with which they are connected. Sublimation is usually conducted in one vessel, the product being deposited in the upper part of the vessel in a solid state, and often in the crystalline form, while the impurity remains in the lower part. If iodine, for example, be heated in a Florence flask, a purple vapour rises, which almost immediately condenses in small brilliant, dark-coloured crystals in the upper part of the flask, the impurity remaining in the lower. The vapour of some substances which undergo the process of sublimation, condenses in the form of a fine powder called *flowers*: such are the *flowers* of sulphur, *flowers* of benzoin, and others of the same kind. Other sublimates require to be in a solid and compact form, as camphor, hydrochlorate of ammonia, and all the sublimates of mercury. — 2. Exaltation; elevation; act of heightening or improving.

4. Grandeur; vastness; elevation, whether exhibited in the works of nature or of art.

Note.—The true nature of sublimity is a subject of great interest and importance in mental philosophy, and it has always been a favourite subject of speculation. The term, psychologically considered, has two significations; one that of the quality or circumstance in objects, which raises the emotion named sublimity; the other that of the emotion itself. The invariable condition in objects, either material or moral, is vastness or intensity. The invariable condition of the emotion of sublimity—that which distinguishes this emotion from every other emotion—is a comprehension of this vastness, with a simultaneous feeling of our own comparative insignificance, together with a concomitant sense of present security from any danger which might result from this superior power. The antithesis to the emotion of sublimity is the emotion of contempt. In every case of sublimity in material objects, whatever feelings may simultaneously concur, vastness will be found to be an invariable condition—vastness either of form or of power; as in the violent dashing of a cataract, in the roar of the ocean, in the violence of the storm, in the majestic quiet of Mount Blanc, preserving its calm amidst all the storms that play around it. In the moral world, the invariable condition of sublimity is intensity—intensity of will. Mere intensity is sufficient to produce the sublime. Lear, who appeals to the heavens, "for they are old like him," is sublime from the very intensity of his sufferings and his passions. Lady Macbeth is sublime from the intensity of her will, which crushes every female feeling for the attainment of her object. Scævola, with his hand in the burning coals, exhibits an intensity of will which is sublime. In all the cases above-mentioned we are moved by a vivid feeling of some greater power than

our own; or some will more capable of suffering, more vast in its strength, than our feeble vacillating will.

Submarine forests have been traced for several miles along the margins of the estuaries on the north and south shores of the county of Fife, and the existence of these may be accounted for by the encroachments of the sea in those estuaries.—*Submarine descent*, the art or operation of diving or descending to the bottom of the sea, and remaining there for a certain time, by means of diving bells or other contrivances. Various purposes are accomplished by submarine descents, such as levelling or clearing the bottoms of harbours, preparing a foundation for buildings under water, raising sunken materials, fishing for pearls, coral, sponges, &c. We say, a stone is a hard *substance*; tallow is a soft *substance*.—2. In a *philosophical* sense, as contradistinguished from *accident*, that which exists independently and unchangeably, whilst *accident* denotes the changeable phenomena in substance, whether these phenomena are necessary or casual, in which latter case they are called *accidents* in a narrower sense. The relation of accident to substance is called the relation of inherence, and corresponds to the logical relation of subject and predicate; because the substance is the subject to which are assigned the qualities, states, and relations, as predicates; substance itself is the essence which is capable of these phenomena, and in spite of these changes, remains the same. Substance is, with respect to the mind, a merely logical distinction from its attributes. We can never imagine it, but we are compelled to assume it. We cannot conceive substance shorn of its attributes, because those attributes are the sole staple of our conceptions, but we must assume that substance is something different from its attributes. Substance is the unknown, unknowable substratum, on which rests all that we experience of the external world.—3. The essential part; the main or material part. the succession, if the first should be unable or unwilling to do so.—*Fidei commissary substitution*, is that in which the second heir is named to receive the succession after the first. In *Scots law*, substitution is defined to be an enumeration of a series of heirs described in proper technical language. There are substitutions also in movables, as in bonds of provision, legacies, &c.—5. In *alge.*, the putting of one quantity in the place of another, to which it is equal but differently expressed. 5. In *music*, the successive notes in melody, in distinction from the successive chords of harmony, called *progression*.—*Law of succession*, in *political economy*, the law or rule according to which the succession to the property of deceased individuals is regulated. In *general*, this law obtains only in cases where a deceased party has died intestate, or in cases where the power of bequeathing property by will is limited by the legislature. In most countries, a preference has been given, in regulating the succession to property vacant by intestacy, and in defining the power to leave property by will, in favour of male heirs; and in some countries, especially in modern times, a marked predilection has been shown in favour of the eldest son, or, as it is usually termed, in favour of the right of *primogeniture*. In England and also in Scotland, when a person possessed of landed property dies intestate, his estate descends entire to his eldest son. The laws of England and of Scotland differ in some respects in regard to succession; but in both countries, the succession opens first to descendants, the preference being given to males. According to the law of England, when there is a failure of lineal descendants, the nearest lineal ancestor succeeds, a father inheriting before a brother, a grandfather before an uncle, &c. In default of father, brothers, or sisters of the whole blood and their issue, the succession opens to the eldest brother or sister of the half blood by a different mother. On failure of male ancestors on the paternal side, and their descendants, female paternal ancestors and their descendants succeed. On failure of these, the mother, her ancestors—first male, then female,—and their respective descendants. In the law of Scotland, in default of descendants, the succession opens to collaterals, as brothers and sisters; but brothers and sisters *uterine* (that is children by the same mother, but not by the same father) do not succeed at all, there being no succession through the mother. Failing descendants and collaterals, the succession opens to ascendants; as, father, grandfather, &c., the mother being excluded. In regard to movable property, the order of succession is the same as in real or heritable property; but here no right of primogeniture, nor any preference of males to females is recognised, the property being divided in equal portions among the children or kinsmen of the deceased, without respect to sex or seniority.—*Apostolical succession*, in *theol.*, the uninterrupted succession of priests in the church by regular ordination, from the first apostles down to the present day.—*Doctrine of the apostolical succession*, the belief that the clergy thus regularly ordained, have a commission from God to preach the gospel, administer the sacraments, and guide the church; and that through their ministration only, we can derive the grace which is communicated by the word and sacraments. Hence, according to this doctrine, those bodies of Christians whose pastors have not this regular succession, have, properly speaking, neither church nor sacraments. This doctrine is maintained by the church of Rome, and by the high-church party in the church of England; but it is repudiated by all other protestant churches.—*Succession of the signs*, in *astron.*, is the order in which the sun enters the signs of the Zodiac; as, Aries, Taurus, Gemini, &c.—*Succession of crops*, in *agriculture*, is more generally called *rotation*.

Suction, strictly speaking, consists in producing a partial vacuum, into which, when made by the mouth or otherwise, the fluid is forced by the external pressure of the atmosphere. The child obtains milk from the breast, by making a vacuum in its mouth, which exhausts the air from the pores

of the nipple, and the milk is consequently ejected from the breast by the unresisted elasticity of the air within.—2. The act of drawing, as fluids, into a pipe or other thing, which is effected on the same principle as that stated above.

Sufficient reason, a term, or rather a principle, introduced by Leibnitz into his system of philosophy. According to this philosopher, all our reasonings are based upon two great principles; the one, that of *consistency,* by means of which we judge that to be false which involves a contradiction, and that to be true which is the reverse of the false; the other, that of *sufficient reason,* which admits nothing to exist without a sufficient reason of its existence, though that reason may not be known to us. Of contingent truths or facts, a sufficient reason must be found which may be traced up through a series of preceding contingencies, till they ultimately terminate in a necessary substance, which is a sufficient reason of the whole series of changes, and with which the whole series is connected. In this way Leibnitz demonstrated the being of God. The same principle has been employed in mathematics, to prove the equality of symmetrical solids or magnitudes which cannot be made to coincide or to fill the same space. Playfair, in his notes to his edition of Euclid's Elements, has expressed this principle as a general axiom, thus: "Things of which the magnitude is determined by conditions that are exactly the same, are equal to one another; or two magnitudes A and B are equal, when there is no reason that A should exceed B, rather than that B should exceed A." [*See* SYMMETRICAL.] By the aid of the principle of *sufficient reason,* we can compare geometrical quantities, whether they be of one, of two, or of three dimensions, nor is there any danger of being misled by this principle so long as it is confined to the objects of mathematical investigation; but in physical questions the same principle cannot be applied with equal safety, because in such cases we have seldom a complete definition of the thing which we reason about, or one which includes all its properties. Still less admissible is this principle in questions of a metaphysical character.

A well known sweet granular substance, prepared chiefly from the expressed juice of the sugar-cane (*Saccharum officinarum*), but obtained also from a great variety of other plants; as maple, beet root, birch, parsnep, &c. The process of manufacturing sugar, as carried on in our West India Islands, consists in pressing out the juice of the canes by passing them between the rollers of a rolling-mill. The juice is received in a shallow trough placed beneath the rollers. This saccharine liquor is concentrated by boiling, which expels the water; lime is added to neutralize the acid that is usually present; the grosser impurities rise to the surface, and are separated in the form of scum. When duly concentrated, the syrup is run off into shallow wooden coolers, where it concretes; it is then put into hogsheads with holes in the bottom, through which the molasses drain off into cisterns below, leaving the sugar in the state known in commerce by the name of *raw* or *muscovado* sugar. This is further purified by means of clay, or more extensively by bullocks' blood, which, forming a coagulum, envelopes the impurities. Thus clarified, it takes the names of *lump, loaf, refined,* &c., according to the different degrees of purification. The manufacture of sugar from beet root is carried on to a very considerable extent in several parts of the Continent, particularly in France. In the United States and in Canada, great quantities of sugar are obtained from the sap of the sugar maple (*Acer saccharinum*), but this kind of sugar is inferior both in grain and strength to that which is produced from the cane. Sugar is a proximate element of the vegetable kingdom, and is found in most ripe fruits, and many farinaceous roots. By fermentation, sugar is converted into alcohol, and hence forms the basis of those substances which are used for making intoxicating liquors, as molasses, grapes, apples, malt, &c. The *ultimate* elements of sugar are oxygen, carbon, and hydrogen. The West Indies, Brazil, Surinam, Java, Mauritius, Bengal, Siam, the Isle de Bourbon, and the Philippine Islands, are the principal sources whence the supplies of sugar required for the European and American markets are derived. Sugar in this country ranks rather among the indispensable necessaries of life, than among luxuries. Of all vegetable principles, it is considered by many eminent physicians as the most wholesome and nutritious.—2. *Sugar of lead,* the acetate of lead; called *saccharum saturni* by the older chemists, from a supposed resemblance in its crystals to sugar, or from their having a slight sweetness in the mouth. Sugar of lead, though poisonous, is useful in medicine, having a strongly detersive quality; and is much employed in calico-printing.—3. *Sugar of milk,* lactine,—*which see.*

SUGAR-CANE, *n.* [*sugar* and *cane.*] The cane or plant from whose juice sugar is obtained; *Saccharum officinarum.* It resembles the reeds common in morasses, except that its skin is soft, and its pulp a spongeous substance. It usually grows to the height of 18 to 20 feet, with a diameter of two inches. It is divided by knots at the distance of 18 inches from each other. At its top it protrudes several long green leaves, and in the centre of these is its flower. When the leaves springing from the knots decay, the plant is ripe. It is then cut, stripped of its leaves, and carried to the mills, where it is crushed and its juice expressed. [*See* SACCHARUM.]

To obtain the sap the trees are perforated at the proper season (February and March), and tubes inserted into the orifices. Through these tubes the sap flows, and is received in troughs. From the troughs it is conveyed to boilers, and manufactured into sugar on the spot [*See* MAPLE.]

SUGAR-MILL, *n.* A machine for pressing out the juice of the sugar-cane. It consists of three rollers placed vertically or horizontally, and parallel to each other. These are driven by a steam-engine, by water, or by animal power. The canes are made to pass between the rollers, by which means they are crushed, and the juice expressed from them. The annexed illustration represents the form of sugar-mill generally in use in our colonies. The motive power (derived either from a steam-engine or a cattle gin), is applied to the upper roller *a,* through the shaft *d,* and is communicated with an equal velocity, by means of the spur pinions *b* and *c,* to the two lower rollers, which are brought nearly into contact with the upper. The canes are spread upon the feeding table *e,* regularly, and, as nearly as possible, at right angles to the axes of the rollers, by which they are drawn forward and crushed so as to separate the liquor, which flows downwards into the hollow bed of the mill, and is then drawn off by a spout *g,* while the empty canes are detached from the rollers, and guided to the floor of the mill by the delivering board *f.*

SU'ICIDE, *n.* [Fr. from L. *suicidium; se* and *cædo*, to slay.] 1. Self-murder; the act of designedly destroying one's own life. To constitute suicide, in a legal sense, the person must be of years of discretion and of sound mind. Suicide, by the law of England, is a crime, the legal effect of which is a forfeiture to the crown of all the personal property which the party had at the time he committed the act by which the death was caused, including debts due to him, but it is not attended with forfeiture of freehold, or corruption of blood. In order to vest these chattels in the crown, the fact of self-murder must be proved by an inquisition. In *Scots law*, suicide draws after it the falling of the single escheat, or forfeiture to the crown of the person's movable estate; and a proof of the self-murder may be brought in an action before the court of session, at the instance of the queen's donatory, against the executors of the deceased. —2. SU'IDÆ, *n.* [L. *sus*, a hog or a swine.] Swine, a family of pachydermatous mammalia, of high importance to man for economical purposes. The animals composing this family are characterized by having on each foot two large principal toes, shod with stout hoofs, and two lateral toes, which are much shorter, and hardly touch the earth. The incisor teeth are variable in number, but the lower incisors are all levelled forwards; the canines are projected from the mouth and recurved upwards. The muzzle is terminated by a truncated snout, fitted for turning up the ground. The family includes the domestic hog, of which there is an endless variety of

Wild Boar (Sus scrofa).

breeds; the wild boar, (*Sus scrofa*, Linn.,) which is the parent stock of our domestic hog; the masked boar of Africa, *Phacochaerus;* the *Babyroussa*,

Collared Peccary (Sus Tajussu.)

a native of Asia; and the Peccary, (*Dicotyles*, Cuv.,) a native of America.

SU'I GEN'ERIS. [L.] Of its own or peculiar kind; singular.

SUIL'LAGE,† *n.* [Fr. *souillage*] Drain of filth.

SU'ING, *ppr.* of *Sue*. Prosecuting.

SU'ING,† *n.* [Fr. *suer*, to sweat, L *sudo.*] The process of soaking through any thing.

SUIT, *n.* [Norm. *suit* or *suyt;* Fr. *suite*, from *suivre*, to follow, from L. *sequor*. *See* SEEK. In Law Latin, *secta* is from the same source.] Literally, a following; and so used in the old English statutes. 1. Consecution; succession; series; regular order; as, the same kind and suit of weather. [*Not now so applied*]—2. A set; a number of things used together, and in a degree necessary to be united, in order to answer the purpose; as, a *suit* of curtains; a *suit* of armour; a *suit* of sails for a ship; sometimes with less dependence of the particular parts on each other, but still united in use; as, a *suit* of clothes; a *suit* of apartments. —3. A set of the same kind or stamp; as, a *suit* of cards.—4 Retinue; a company or number of attendants or followers; attendance; train; as, a nobleman and his *suit*. But in this sense the word is usually written *suite*,—*which see.*—5. A petition made to the king or to any great person; a seeking for something by petition or application.

> Many shall make *suit* to thee; Job xi.

6. Solicitation of a woman in marriage; courtship.—7. In *law*, an action or process for the recovery of a right or claim; legal application to a court for justice; prosecution of right before any tribunal; as, a civil *suit;* a criminal *suit;* a *suit* in chancery. Where the remedy is sought in a court of law, the term *suit* is synonymous with *action;* but when the proceeding is in a court of equity, the term *suit* alone is used. The term is also applied to proceedings in the ecclesiastical and admiralty courts.

> In England, the several *suits* or remedial instruments of justice, are distinguished into three kinds, actions personal, real, and mixed. *Blackstone.*

8. Pursuit; prosecution; chase.—*Suit and service*, in *feudal law*, the duty of feudatories to attend the courts of their lords or superiors in time of peace, and in war to follow them and perform military service.—*To bring suit*, a phrase in law, denoting literally to bring *secta*, followers or witnesses to prove the plaintiff's demand. The phrase is antiquated, or rather it has changed its signification; for to *bring a suit*, now is to institute an action.—*Out of suits*, having no correspondence.—*Suit-covenant*, in *law*, is a covenant to sue at a certain court.—*Suit-court*, in *law*, the court in which tenants owe attendance to their lord.—*Suit of court*, an obligation to follow; that is, to attend, and to assist in constituting a court. It is either *real* or *personal*. *Suit-real*, or rather *suit-regal*, is the obligation under which all the residents within a lect or town are bound, in respect of their allegiance as subjects, to attend the king's criminal court for the district.—*Suit-personal*, is an obligation to attend the civil courts of the lord under whom the suitor holds lands or tenements, and this is either *suit-service* or *suit-custom*. If freehold lands, &c., be holden of the king immediately, suit-service is performed by attendance at the county court. If freehold lands, &c., are held mediately only of the king, but immediately of an inferior lord, the suit-service demandable is attendance at the court-baron of the lord. In manors where there are copyhold estates, the custom of the manor imposes upon the copyholder an obligation to attend the lord's customary court; but as this obligation is not annexed by the tenure to the land held by the copyholder, but is annexed by custom to his position as tenant, the suit is not suit-service, but *suit-custom*.

SULPHA'SATYDE, *n.* A substance formed by the action of potash on sulphesatyde, from which it differs but slightly. It is a white crystalline powder.

SUL'PHATE, *n.* [from *sulphur.*] A salt formed by sulphuric acid in combination with any base; as, *sulphate* of lime. Of the sulphates, some are found native; some are very soluble, some sparingly soluble, and some insoluble. All those that are soluble are recognized in solution by the test of nitrate of baryta, which causes a white precipitate of sulphate of baryta, insoluble in acids. All the insoluble sulphates, when fused with carbonate of soda, yield sulphate of soda, which may be recognized as above. Some neutral sulphates occur in the anhydrous state, and others occur combined with water. The most important sulphates are:—Sulphate of alumina and potash or alum; sulphate of ammonia, employed for making carbonate of ammonia; sulphate of copper, or blue vitriol, much used as an escharotic in surgery; and also used in dyeing, and for preparing certain green pigments; sulphate of iron, or green vitriol, used in making ink, and very extensively in dyeing, and calico printing; it is also much used in medicine; sulphate of lime or gypsum; sulphate of magnesia, or Epsom salts; sulphate of manganese, used in calico printing; sulphate of peroxide of mercury, used in the preparation of corrosive sublimate, and of calomel; bisulphate of potash, much used as a flux in mineral analysis; sulphate of soda, or Glauber's salts; sulphate of quinia, much used in medicine; sulphate of zinc, or white vitriol, used in surgery, also in the preparation of drying oils for varnishes, and in the reserve or resist pastes of the calico printer. Some of the sulphates are double; as the sulphate of magnesia and potash, the sulphate of alumina and potash or alum.

The blue solution contains two acids, sulphoindigotic acid, and hypo-sulphoindigotic acid.

SULPHOLE'IC ACID, *n.* When a mixture of oleine and margarine is acted on by sulphuric acid, two new acids are formed, *sulpholeic acid*, and *sulphomargaric acid.* Little is known respecting them.

SUL'PHOSELS, SUL'PHUR SALTS, *n.* The name given by Berzelius to certain double sulphurets. The simple sulphurets, by the union of which a sulphur salt is formed, are bi-elementary compounds, strictly analogous in their constitution to acids and alkaline bases; and, like them, are capable of assuming opposite electric

energies in relation to each other. Electro-positive sulphurets are termed *sulphur bases*, and the electro-negative sulphurets, *sulphur acids*. The principal sulphur bases are the protosulphurets of potassium, sodium, lithium, barium, strontium, calcium, and magnesium, and hydro-sulphate of ammonia; and the principal sulphur acids are the sulphurets of arsenic, antimony, tungsten, molybdenum, tellurium, tin, and gold, together with hydrosulphuric acid, bisulphuret of carbon, and sulphuret of selenium. The compounds resulting from the union of a sulphuret of the former class with one of the latter, constitute *sulphur salts*, or *sulphosels*. These are analogous to oxy-salts.

SULPHOSINAP'ISINE, *n.* In *chem.*, a crystallizable substance, obtained from mustard-seed.

SULPHOVI'NATE, *n.* A double salt formed by the union of sulphovinic acid with a base; as, *sulphovinate* of etherole, or heavy oil of wine.

SULPHOVIN'IC ACID, *n.* An acid produced by the action of sulphuric acid upon alcohol, and called also acid sulphate of oxide of ethyle. To obtain it pure, the double sulphate of ethyle and baryta in solution is decomposed by sulphuric acid, and the filtered liquid is a solution in water of the acid sulphate. It has a very sour taste, and cannot be concentrated by evaporation without being decomposed into alcohol and sulphuric acid. It forms with most bases crystallizable double salts, called *sulphovinates*, which are all soluble.

SUL'PHUR, *n.* [L., whence Fr. *soufre*.] Brimstone, a simple non-metallic combustible substance, which has been known from the earliest ages of the world. It occurs in great abundance in the mineral, sparingly in the vegetable, and still more sparingly in the animal kingdom. It occurs sometimes pure or merely mixed, and sometimes in chemical combination with oxygen and various metals, forming sulphates and sulphurets. It is found in greatest abundance and purity in the neighbourhood of volcanoes, modern or extinct, as at Solfatara, in Italy; and, as an article of commerce, is chiefly imported from the Mediterranean. That which is manufactured in this country is obtained by the roasting of iron pyrites. It is commonly met with in two forms; that of a compact, brittle solid, and a fine powder. It is nearly tasteless, of a greenish yellow colour, and when rubbed or melted emits a peculiar odour. Its specific gravity is 1·99; it is insoluble in water, and not very readily soluble in alcohol, but is taken up by spirits of turpentine. It is a non-conductor of electricity. It is readily melted and volatilized. It fuses at 232°, and between 232° and 280° it possesses the greatest degree of fluidity, and when cast into cylindrical moulds, forms the common roll-sulphur of commerce. It possesses the peculiar property of solidifying at a higher degree, or when raised to 320°. Between 428° and 482° it is very tenacious. From 482° to its boiling point (600°) it again becomes liquid. At 600° it rises in vapour, and in close vessels condenses in the form of a fine yellow powder, called *flowers of sulphur*. When sulphur is heated to at least 428°, and then poured into water, it becomes a ductile mass, and may be employed for taking the impressions of seals and medals. Sulphur combines with oxygen, hydrogen, chlorine, &c., forming various important compounds. It unites also with the metals forming sulphurets. It is of great importance in the arts, being employed in the manufacture of gunpowder, and in the formation of sulphuric acid. It is also employed in medicine, and for various other purposes.

SUL'PHURETTED, *a.* Applied to bodies having sulphur in combination. —*Sulphuretted hydrogen*, a compound formed when hydrogen and sulphur come in contact in the nascent state. It is a transparent colourless gas, recognized by its peculiar fetid odour, resembling that of putrid eggs. It is very deleterious to animal life, and is often formed where animal matters or excrements putrify. It extinguishes flame, but is itself combustible. It is the active constituent of sulphureous mineral waters. It is also known by the name of hydro-sulphuric acid, and consists of 1 atom of sulphur and 1 of hydrogen.

SUL'PHURIC, *a.* Pertaining to sulphur. —*Sulphuric acid*, oil of vitriol; a most important acid, discovered by Basil Valentine towards the close of the 15th century. It was formerly procured by the distillation of dried sulphate of iron, called *green vitriol*, whence the corrosive liquid which came over in the distillation, having an oily consistence, was called *oil of vitriol*. It is now prepared in this and most other countries, by burning sulphur along with nitre in large leaden chambers. Pure sulphuric acid is a dense, oily, colourless fluid, having, when strongly concentrated, a specific gravity of about 1·8. It is exceedingly acid and corrosive, decomposing all animal and vegetable substances by the aid of heat. It unites with alkaline substances, and separates all other acids, more or less completely, from their combinations with the alkalies. It has a very great affinity for water, and unites with it in every proportion, producing great heat; it attracts moisture strongly from the atmosphere, becoming rapidly weaker if exposed. The sulphuric acid of commerce is never pure, but it may be purified by distillation. With bases sulphuric acid forms salts, called sulphates, some of which are neutral, and others acid. Common sulphuric acid is properly hydrated sulphuric acid, which may be regarded as a compound of 1 atom of dry acid, and 1 of water.—*Fuming sulphuric acid*, or that obtained by distilling partially dried green vitriol, consists of 2 equivalents of anhydrous or dry acid, and 1 equivalent of water. The best test of the presence of sulphuric acid, whether free or combined, is a soluble compound of barium. Thus, when a solution of chloride of barium is added to a liquid containing sulphuric acid, it causes a white precipitate; viz., sulphate of baryta, which is not only insoluble in water, but in the strongest acids. Of all the acids the sulphuric is the most extensively used in the arts, and is in fact the primary agent for obtaining almost all the others by disengaging them from their saline combinations. Its uses to the scientific chemist are innumerable. In medicine it is used in a diluted state, as a refrigerant.

SULPHU'RIC ETHER, *n.* A colourless transparent liquid, of a pleasant smell and a pungent taste, extremely exhilarating, and producing a degree of intoxication when its vapour is inhaled by the nostrils. It is produced by distilling a mixture of equal weights of sulphuric acid and alcohol, and by various other means. It consists of 4 atoms of carbon, 5 of hydrogen, and 1 of oxygen, and has a specific gravity of 0·75. It is extremely volatile, and highly inflammable; and its vapour, mixed with oxygen or atmospheric air, forms a very dangerous explosive mixture. It dissolves in 10 parts of water, and is miscible with alcohol and the fatty and volatile oils in all proportions. It is employed in medicine as a stimulant and antispasmodic. The vapour of ether was recently administered, with great success, to patients when about to undergo surgical operations. The patient was made to inhale the vapour by means of an apparatus contrived for the purpose, in consequence of which he was thrown into a state of stupor, and was thus enabled to undergo the operation without any sensation of pain. Sulphuric ether, as an anæsthetic agent in surgical operations, is now, however, superseded by chloroform.

SUL'PHUROUS, *a.* Like sulphur; containing sulphur.—*Sulphurous acid*, an acid formed by the combustion of sulphur in air or dry oxygen, consisting of 1 equivalent of sulphur, and 2 of oxygen. It is a transparent and colourless gas, of a disagreeable taste, a pungent and suffocating odour, is fatal to life, and very injurious to vegetation. At 45°, under the pressure of two atmospheres, it becomes liquid, and also at 0° under the pressure of one atmosphere. It extinguishes flame, but is not itself inflammable. It has consi-

derable bleaching properties, so that the fumes of burning sulphur are often used to whiten straw, and silk and cotton goods. It combines with metallic oxides, forming salts called *sulphites*.

SUM'MER, *n.* [Sax. *sumer, sumor;* G. and Dan. *sommer;* Ir. *samh*, the sun, and summer, and *samhradh*, summer.] One of the four seasons of the year, in the popular acceptation of the term, including May, June, and July. Astronomically considered, summer begins in the northern hemisphere when the sun enters Cancer, about the 21st of June, and continues for three months, till Sept. 23d; during which time, the sun being north of the equator, shines more directly upon this part of the earth, which renders this the hottest period of the year. In latitudes south of the equator, just the opposite takes place, or it is summer there when it is winter here. The entire year is also sometimes divided into summer and winter, the former signifying the warmer and the latter the colder part of the year.—*Indian summer*, in the *U. States*, a period of warm weather late in autumn, when, it is said, the Indians go hunting to supply themselves with the flesh of wild animals for provisions in the winter.

SUN, *n.* [Sax. *sunna;* G. *sonne;* Sans. *sunuh.* The Danish has *Sönday*, Sunday, Slav. *Sonze.* Qu. W. *tan*, Ir. *teine*, fire, and *shan*, in *Bethshan*.] 1. The splendid orb or luminary which, being in or near the centre of our system of worlds, gives light and heat to all the planets, and is therefore the primary cause of all the motions and changes effected on the surface of our globe by those mighty agents. The light of the sun constitutes the day, and the darkness which proceeds from its absence, or the shade of the earth, constitutes the night; Ps. cxxxvi. All the planets and comets of our system revolve round the sun as a common centre, at different distances and in different periods of time. His mean apparent diameter is about 32 minutes, and his mean distance from the earth about 95,000,000 of miles. His real diameter is 882,000 miles, and hence his magnitude is 1,384,472 times that of the earth, but his mass or quantity of matter is only about 28 times that of the earth. He revolves on his axis from west to east in 25¼ of our mean solar days, his axis being inclined at an angle of 82° 40′ to the plane of the ecliptic. When viewed through powerful telescopes the sun's disc is observed to have frequently large and perfectly black spots upon it. These spots are of various irregular shapes, and of various sizes, from the least visible to the twentieth part of the sun in diameter. They alter in size and gradually vanish, lasting from a few days to six or seven weeks. Herschel conjectures that the shining matter of the sun consists of a mass of phosphoric clouds, floating above his atmosphere, or else mixed with the higher strata of it, and that owing to disturbances in the equilibrium of this luminous atmosphere, openings are made through it; and that therefore a spot on the sun is a portion of the body of the sun itself, seen through one of these openings. Several hypotheses have been advanced respecting the emission of heat and light from the sun, but none of them are satisfactory. The sun, besides his motion round his own axis, revolves round the common centre of gravity of the solar system, which centre is a point within the body of the sun. The apparent diurnal motion of the sun from east to west, is owing to the revolution of the earth on its axis, and his apparent annual path in the ecliptic from west to east, is owing to the motion of the earth round the sun in an elliptical orbit, the sun being in one of the foci. Astronomers seem to have ascertained beyond a doubt that the sun has a proper motion in space, and is advancing along with the planets toward some distant point among the fixed stars.—2. In *popular usage*, a sunny place; a place where the beams of the sun fall; as, to stand in the *sun*, that is, to stand where the direct rays of the sun fall.—3. We apply the word *superstition* to the idolatry of the heathens; we apply it also to the Jews, who made the will of God of no effect by their traditions, and substituted ceremonies in place of the religion of their fathers. It is applied to the unscriptural opinions, rites, and ceremonies of the Roman catholics; and to those protestants who esteem baptism and the Lord's Supper, and the punctual observance of other ceremonies, without regard to morality, as sufficient to ensure salvation. Those persons are also reckoned superstitious who believe, without any evidence, that prophecies are still uttered by divine inspiration, and that miracles are still performed. The word is also extended to those who believe in witchcraft, magic, and apparitions, or that the divine will is declared by omens, or augury; that the fortune of individuals can be affected by things indifferent, by things deemed lucky or unlucky, or that diseases can be cured by words, charms, or incantations.—2. SUPREM'ACY, *n.* [*See* SUPREME.] State of being supreme or in the highest station of power; highest authority or power; as, the *supremacy* of the king of Great Britain; or the *supremacy* of parliament. The term, however, is used particularly to signify supreme and undivided authority in ecclesiastical affairs. This is either papal or regal. Papal supremacy is the authority, legislative, judicial, and executive, which the pope exercised over the churches of England, Scotland, and Ireland, until the middle of the 16th century, when it was abolished, and which he still exercises, *de facto*, over that portion of the inhabitants of those countries who are in communion with the church of Rome. Regal supremacy is the authority and jurisdiction which the king of England exercises over the church of England, as being the supreme head of that church. This authority is not legislative, but judicial and executive only. Henry VIII. was first acknowledged supreme head of the church in 1528; and this supremacy was confirmed by parliament to him, his heirs, and successors, kings of this realm in 1534. Regal supremacy over the church is not recognized by the established church of Scotland, as it acknowledges no head upon earth.—*Oath of supremacy.* In *Great Britain*, an oath which renounces or abjures the supremacy of the pope in ecclesiastical or temporal affairs in this realm. It is, properly speaking, an oath of non-supremacy, since it negatives the pope's supremacy, and is silent as to any supremacy of the king. It was by many statutes required to be taken, along with the oath of allegiance, by persons in order to qualify themselves for office, &c.; but it is now become almost an unmeaning form.

SUPREME, *a.* [L. *supremus*, from *supra*; Fr. *suprême.*] 1. Highest in authority; holding the highest place in government or power. The parliament of Great Britain is *supreme* in legislation; but the king is *supreme* in the administration of the government. SURD, *n.* In *alge.*, an irrational quantity; a quantity which is incommensurable to unity. Or, a *surd* denotes the root of any quantity, when that quantity is not a complete power of the dimension required by the index of the root. Hence, the roots of such quantities cannot be expressed by rational numbers. Thus the square root of 2, the cube root of 4, the fourth root of 7, &c., are surds, for they cannot be expressed by rational numbers. Surds are usually represented by prefixing the radical signs indicating the operation; thus, $\sqrt{2}$, $\sqrt[3]{4}$, $\sqrt[4]{7}$, or they may be expressed by fractional indexes; thus, $2^{\frac{1}{2}}$, $4^{\frac{1}{3}}$, $7^{\frac{1}{4}}$, &c. If 2, 4, and 7 be represented by *a*, *b*, and *c*, then $\sqrt{a}$, $\sqrt[3]{b}$, and $\sqrt[4]{c} = a^{\frac{1}{2}}, b^{\frac{1}{3}}, c^{\frac{1}{4}}$ are surds. Any rational quantity may be expressed in the form of a surd by reducing its integral index to an equivalent fraction; thus, $a = a^{\frac{2}{2}}$, or $a^{\frac{3}{3}}$.

SURD'ITY,† *n.* Deafness.

Magistrates, and justices of the peace, have the power to take such recognizances. A magistrate or a justice of the peace may, according to his discretion, bind all those to keep the peace, who, in his presence, shall make any affray, or shall threaten to kill or beat any person, or shall contend together in hot words; and all those who shall go about with unlawful weapons, or attendance to the terror of the people; and all such persons as shall be known by him to be common barrators, and who shall be brought before him by a constable, for a breach of the peace, in the presence of such constable; and all such persons who, having been before bound to keep the peace, shall be convicted of having forfeited their recognizance. Such recognizance may be obtained by any party from another, on application to a magistrate, and stating on oath that he has just cause to fear that such other "will burn his house or do him a corporal hurt, or, that he will procure others to do him mischief." This kind of surety is termed, in Scots law, *law burrows*. Sureties may be similarly required for the good behaviour of parties who have been guilty of conduct tending to a breach of the peace.

SUR'FACE, *n.* [Fr. *sur*, upon, and *face*.] The exterior part of any thing that has length and breadth; one of the limits that terminates a solid; the superficies; outside; as, the *surface* of the earth; the *surface* of the sea; the *surface* of a diamond; the *surface* of the body; the *surface* of a cylinder; an even or an uneven *surface*; a smooth or rough *surface*; a spherical *surface*. In *geom.*, a surface or superficies is defined to be "that which has length and breadth only," and is thus distinguished from a line which has length only, and from a solid, which has length, breadth, and thickness. The extremities of a surface are lines, and the intersections of one surface with another are also lines. A *plane surface*, is that in which any two points being taken,

the straight line between them lies wholly in that surface. A surface which may be cut by a plane through any given point, so that the line of common section of the plane and surface may be a curve, is called a *curved surface;* as, the surface of a sphere, cylinder, or cone. Surfaces are distinguished algebraically by the nature and order of their equations. Thus, we have surfaces of the first order, or plane surfaces, and surfaces of the second order, or curved surfaces. Surfaces are also distinguished by their mode of generation; thus the surface of a sphere is generated by the revolution of a semicircular arc about the diameter, which remains fixed. In *physics*, a surface is supposed to be composed of a number of material particles, placed together side by side, without any opening or interstice between them. Such a surface, therefore, cannot be said to be absolutely destitute of thickness, but may be regarded as a film of matter whose thickness is indefinitely small. In *common language*, the word surface is often used to signify not merely the outside or exterior boundary of any substance, but also a certain thickness of the exterior material part. In this way we speak of the *surface* of the earth, the *surface* of the soil, of taking off the surface of any thing, &c.—*Surface damage*, in *Scots law*, damage done to the surface of the ground in consequence of mining operations, &c.

SUR'ĠEON, *n.* (sur'jon.) [contracted from *chirurgeon*.] In a limited sense, one whose profession or occupation is to cure diseases or injuries of the body by manual operation. In a more general sense, one whose occupation is to cure external diseases, whether by manual operation, or by medicines externally or internally. But this latter definition is still too limited, as there are many diseases which cannot be considered *external*, and which, according to modern practice, fall within the province of the surgeon. The truth is, no accurate definition of the term has yet been given, for the reasons stated under *surgery*,—*which see*.

SUR'ĠEONCY, *n.* The office of surgeon in the army or navy.

SUR'ĠEONRY,† *n.* The practice of a surgeon; surgery; a surgery.

SUR'ĠERY, *n.* Originally, the manual procedure by means of instruments or not, directed towards the repair of injury, and the cure of disease, in contradistinction to the practice of *medicine*, denoting the treatment of disease by the administration of drugs or other substances, supposed to be of a sanative tendency. The matured progress, however, of the healing art, has rendered such a definition of surgery, in these days, utterly untenable. Many attempts have been made to define surgery according to its present state, so as to prevent interference with the department of physic. By some it has been represented as that branch of medicine which principally effects the cure of diseases by the application of the hand alone, by the employment of instruments, or the use of topical remedies; but this definition is more applicable to the state of surgery some centuries ago, than to the present state of practice. By some writers surgery is said to have for its object the treatment of external diseases, while physic treats of internal diseases. This definition can only be received with numerous exceptions in regard to modern practice, for there are many internal disorders, which are universally allowed to constitute strictly surgical cases; as, for instance, the psoas abscess; stone in the bladder, polypi, and scirrhus of the uterus, stricture of the œsophagus, an extravasation of blood within the skull in consequence of accidental violence. Others have defined surgery to be the mechanical part of physic; but this definition is equally objectionable, as it confines this branch of medicine within too narrow limits. The fact is, that the line of demarcation between surgery and physic cannot be easily traced, nor is it desirable that the attempt should be made. Their principles are the same throughout, and the exercise of their different branches requires the same fundamental knowledge. The physician, before he can be accomplished or successful in his profession, must be intimate with the principles, if not with the practice, of surgery. On the other hand, no one can lay claim to the title of surgeon, far less hope for eminence or success, unless he be equally qualified to assume both the appellation and the employment of the physician. Surgery, however, in its common acceptation, has been understood to include: 1. The treatment of injuries of all kinds; 2. Of the greater part of external and local complaints; 3. Of such internal affections as produce changes recognizable externally; for example, alterations of figure, colour, or consistence; 4. Of all cases requiring external topical treatment, operations, or manual proceedings of any kind. Still there are various exceptions to some of the above principles of classification.

The striped surmullet (*M. surmuletus*, Linn.,) is somewhat smaller, but equal to the red surmullet in delicacy. [*See* MULLET.]

SUR'NAME, *n.* [Fr. *surnom;* It. *soprannome;* Sp. *sobrenombre;* L. *super* and *nomen.*] 1. An additional name; a name or appellation added to the baptismal or Christian name, and which becomes a family name. Surnames, with us, originally designated occupation, estate, place of residence, or some particular thing or event that related to the person. Thus William *Rufus* or *red;* Edmund *Ironsides;* Robert *Smith*, or the *smith;* William *Turner*. Surnames seem to have been formed at first by adding the name of the father to that of the son, and in this manner several of our surnames were produced. Thus from Thomas William's son we have Thomas Williamson; from John's son we have Johnson, &c. Surnames are said to have been first assumed in England a little before the Conquest, but they were never fully established among the common people till the time of Edward II. They seem to have been introduced into Scotland in the time of William the Conqueror.—2. An appellation added to the original name.
